84TH
EDITION
2003 - 2004

CRC PRESS

PREFACE

The 84th Edition of the *CRC Handbook of Chemistry and Physics* features a completely new version of the most heavily used table, Physical Constants of Organic Compounds. This is the first revision of the table since 1994. Compounds have been selected for inclusion in the new table by a careful screening of lists of organic compounds that are important in laboratory research, industrial chemistry, environmental protection, drug development, teaching, and other active areas. In this way priorities were established for choosing the most significant compounds out of the millions of organic substances that have been reported in the literature. Property data for the selected compounds have been updated, and new structure diagrams, which show much more detail than the previous structures, have been drawn for all the compounds.

This Internet version of the 84th Edition has added 17 new subsections that can be accessed as interactive tables. These include tables on Heat of Combustion, Activity Coefficients, Refrigerants, Amino Acids, Chemical Carcinogens, Laboratory Solvents, and other topics. The search screens have been modified to make them more user friendly, and there is now a subject index that permits boolean searching on the name of a physical property and the identifiers of a chemical substance (name, formula, or CAS Registry Number). An option has been added to the table displays that permits locking the left-most column, which usually contains the chemical name, when scanning a wide table. Tool-tips that explain the data in a column now appear when the cursor is held over that column heading, and it is now possible to export the results of a search directly into an Excel file.

Other new features of the 84th Edition include:

- An update and expansion of the table of Critical Constants of Fluids, with many new compounds and recently published data
- A new version of Properties of Refrigerants, which covers fluids now used in refrigeration systems and those being considered as substitutes
- A new table on Fermi Energy and Related Properties of Metals
- New tables of practical laboratory data such as Flame and Bead tests, Flame Temperatures, and Density of Ethanol-Water Mixtures
- An update of lists of Chemical Carcinogens and Interstellar Molecules.

The *Handbook of Chemistry and Physics* is dependent on the efforts of many contributors throughout the world. The list of current contributors follows this Preface. The new table of Physical Constants of Organic Compounds could not have been completed without the help of Dr. Fiona Macdonald, who oversaw the structure drawing and checked names and formulas. Thanks are also due to Janice Shackleton, Trupti Desai, Nazila Kamaly, Matt Griffiths, and Lawrence Braschi, who participated in drawing the structures.

David R. Lide
October 27, 2003

This Edition is dedicated to my grandchildren:
Mary Eleanor Lide
David Alston Lide, Jr.
Grace Eileen Lide
David Austell Whitcomb
Kate Elizabeth Whitcomb

This work contains information obtained from authentic and highly regarded sources. Reprinted material is quoted with permission, and sources are indicated. A wide variety of references are listed. Reasonable efforts have been made to publish reliable data and information, but the author and the publisher cannot accept responsibility for the validity of all materials or for the consequences of their use.

FUNDAMENTAL PHYSICAL CONSTANTS

Peter J. Mohr and Barry N. Taylor

These tables give the 1998 self-consistent set of values of the basic constants and conversion factors of physics and chemistry recommended by the Committee on Data for Science and Technology (CODATA) for international use. The 1998 set replaces the previous set of constants recommended by CODATA in 1986; assigned uncertainties have been reduced by a factor of 1/5 to 1/12 (and sometimes even greater) relative to the 1986 uncertainties. The recommended set is based on a least-squares adjustment involving all of the relevant experimental and theoretical data available through December 31, 1998. Full details of the input data and the adjustment procedure are given in Reference 1.

The 1998 adjustment was carried out by P. J. Mohr and B. N. Taylor of the National Institute of Standards and Technology (NIST) under the auspices of the CODATA Task Group on Fundamental Constants. The Task Group was established in 1969 with the aim of periodically providing the scientific and technological communities with a self-consistent set of internationally recommended values of the fundamental physical constants based on all applicable information available at a given point in time. The first set was published in 1973 and was followed by a revised set first published in 1986; the current 1998 set first appeared in 1999. In the future, the CODATA Task Group plans to take advantage of the high level of automation developed for the current set in order to issue a new set of recommended values at least every four years.

At the time of completion of the 1998 adjustment, the membership of the Task Group was as follows:

F. Cabiati, Istituto Elettrotecnico Nazionale "Galileo Ferraris," Italy
E. R. Cohen, Science Center, Rockwell International (retired), United States of America
T. Endo, Electrotechnical Laboratory, Japan
R. Liu, National Institute of Metrology, China (People's Republic of)

^a See the “Adopted values” table for the conventional value adopted internationally for realizing representations of the volt using the Josephson effect.

^b See the “Adopted values” table for the conventional value adopted internationally for realizing representations of the ohm using the quantum Hall effect.

^c Value recommended by the Particle Data Group, Caso et al., Eur. Phys. J. C **3**(1-4), 1-794 (1998).

^d Based on the ratio of the masses of the W and Z bosons m_W/m_Z recommended by the Particle Data Group (Caso et al., 1998). The value for $\sin^2\theta_W$ they recommend, which is based on a particular variant of the modified minimal subtraction ($\overline{\text{MS}}$) scheme, is $\sin^2\hat{\theta}_W(M_Z) = 0.231\,24(24)$.

^e The helion, symbol h, is the nucleus of the ^3He atom.

^f This and all other values involving m_τ are based on the value of $m_\tau c^2$ in MeV recommended by the Particle Data Group, Caso et al., Eur. Phys. J. C **3**(1-4), 1-794 (1998), but with a standard uncertainty of 0.29 MeV rather than the quoted uncertainty of -0.26 MeV , $+0.29 \text{ MeV}$.

^g The numerical value of F to be used in coulometric chemical measurements is $96\,485.3432(76)$ [7.9×10^{-8}] when the relevant current is measured in terms of representations of the volt and ohm based on the Josephson and quantum Hall effects and the internationally adopted conventional values of the Josephson and von Klitzing constants K_{J-90} and R_{K-90} given in the “Adopted values” table.

^h The entropy of an ideal monoatomic gas of relative atomic mass A_r is given by $S = S_0 + \frac{3}{2}R \ln A_r - R \ln(p/p_0) + \frac{5}{2}R \ln(T/K)$.

Fundamental Physical Constants — Adopted values

Quantity	Symbol	Value	Unit	Relative std. uncert. u_r
molar mass of ^{12}C	$M(^{12}\text{C})$	12×10^{-3}	kg mol^{-1}	(exact)
molar mass constant ^a $M(^{12}\text{C})/12$	M_{u}	1×10^{-3}	kg mol^{-1}	(exact)
conventional value of Josephson constant ^b	$K_{\text{J}-90}$	483 597.9	GHz V^{-1}	(exact)
conventional value of von Klitzing constant ^c	$R_{\text{K}-90}$	25 812.807	Ω	(exact)
standard atmosphere		101 325	Pa	(exact)
standard acceleration of gravity	g_{n}	9.806 65	m s^{-2}	(exact)

^a The relative atomic mass $A_r(\text{X})$ of particle X with mass $m(\text{X})$ is defined by $A_r(\text{X}) = m(\text{X})/m_{\text{u}}$, where $m_{\text{u}} = m(^{12}\text{C})/12 = M_{\text{u}}/N_{\text{A}} = 1 \text{ u}$ is the atomic mass constant, N_{A} is the Avogadro constant, and u is the atomic mass unit. Thus the mass of particle X in u is $m(\text{X}) = A_r(\text{X}) \text{ u}$ and the molar mass of X is $M(\text{X}) = A_r(\text{X})M_{\text{u}}$.

^b This is the value adopted internationally for realizing representations of the volt using the Josephson effect.

^c This is the value adopted internationally for realizing representations of the ohm using the quantum Hall effect.

1 m ⁻¹	(1 m ⁻¹) hc/k = $1.438\,7752(25) \times 10^{-2}$ K	(1 m ⁻¹) hc = $1.239\,841\,857(49) \times 10^{-6}$ eV	(1 m ⁻¹) h/c = $1.331\,025\,042(10) \times 10^{-15}$ u	(1 m ⁻¹) hc = $4.556\,335\,252\,750(35) \times 10^{-8}$ E_h
1 Hz	(1 Hz) h/k = $4.799\,2374(84) \times 10^{-11}$ K	(1 Hz) h = $4.135\,667\,27(16) \times 10^{-15}$ eV	(1 Hz) h/c^2 = $4.439\,821\,637(34) \times 10^{-24}$ u	(1 Hz) h = $1.519\,829\,846\,003(12) \times 10^{-16}$ E_h
1 K	(1 K) = 1 K	(1 K) k = $8.617\,342(15) \times 10^{-5}$ eV	(1 K) k/c^2 = $9.251\,098(16) \times 10^{-14}$ u	(1 K) k = $3.166\,8153(55) \times 10^{-6}$ E_h
1 eV	(1 eV)/ k = $1.160\,4506(20) \times 10^4$ K	(1 eV) = 1 eV	(1 eV)/ c^2 = $1.073\,544\,206(43) \times 10^{-9}$ u	(1 eV) = $3.674\,932\,60(14) \times 10^{-2}$ E_h
1 u	(1 u) c^2/k = $1.080\,9528(19) \times 10^{13}$ K	(1 u) c^2 = $931.494\,013(37) \times 10^6$ eV	(1 u) = 1 u	(1 u) c^2 = $3.423\,177\,709(26) \times 10^7$ E_h
1 E_h	(1 E_h)/ k = $3.157\,7465(55) \times 10^5$ K	(1 E_h) = $27.211\,3834(11)$ eV	(1 E_h)/ c^2 = $2.921\,262\,304(22) \times 10^{-8}$ u	(1 E_h) = 1 E_h

Derived from the relations $E = mc^2 = hc/\lambda = h\nu = kT$, and based on the 1998 CODATA adjustment of the values of the constants;
 1 eV = (e/C) J, 1 u = $m_u = \frac{1}{12}m(^{12}\text{C}) = 10^{-3}$ kg mol⁻¹/ N_A , and $E_h = 2R_\infty hc = \alpha^2 m_e c^2$ is the Hartree energy (hartree).

STANDARD ATOMIC WEIGHTS (2001)

This table of atomic weights includes the changes made in 1999 and 2001 by the IUPAC Commission on Atomic Weights and Isotopic Abundances. The Standard Atomic Weights apply to the elements as they exist naturally on Earth, and the uncertainties take into account the isotopic variation found in most laboratory samples. Further comments on the variability are given in the footnotes.

The number in parentheses following the atomic weight value gives the uncertainty in the last digit. An atomic weight entry in brackets indicates that the element that has no stable isotopes; the value given is the atomic mass in u (or the mass number, if the mass is not accurately known) for the isotope of longest half-life. Thorium, protactinium, and uranium have no stable isotopes, but the terrestrial isotopic composition is sufficiently uniform to permit a standard atomic weight to be specified.

- ^a No stable isotope exists. The atomic mass in u (or the mass number, if the mass is not accurately known) is given in brackets for the isotope of longest half-life.
- ^b Commercially available Li materials have atomic weights that range between 6.939 and 6.996; if a more accurate value is required, it must be determined for the specific material.
- ^g Geological specimens are known in which the element has an isotopic composition outside the limits for the normal material. The difference between the atomic weight of the element in such specimens and that given in the table may exceed the stated uncertainty.
- ^m Modified isotopic compositions may be found in commercially available material because it has been subject to an undisclosed or inadvertent isotopic fractionation. Substantial deviations in atomic weight of the element from that given in the table can occur.
- ^r Range in isotopic composition of normal terrestrial material prevents a more precise atomic weight being given; the tabulated value should be applicable to any normal material.

ATOMIC MASSES AND ABUNDANCES

This table lists the mass (in atomic mass units, symbol u) and the natural abundance (in percent) of the stable nuclides and a few important radioactive nuclides. A complete table of all nuclides may be found in Section 11 ("Table of the Isotopes").

The atomic masses are based on the 1995 evaluation of Audi and Wapstra (Reference 2). The number in parentheses following the mass value is the uncertainty in the last digit(s) given.

Natural abundance values are also followed by uncertainties in the last digit(s) of the stated values. This uncertainty includes both the estimated measurement uncertainty and the reported range of variation in different terrestrial sources of the element (see Reference 3 and 4 for more details). The absence of an entry in the Abundance column indicates a radioactive nuclide not present in nature or an element whose isotopic composition varies so widely that a meaningful natural abundance cannot be defined.

An electronic version of these data is available on the Web site of the NIST Physics Laboratory (Reference 5).

INTERNATIONAL TEMPERATURE SCALE OF 1990 (ITS-90)

B. W. Mangum

A new temperature scale, the International Temperature Scale of 1990 (ITS-90), was officially adopted by the Comité International des Poids et Mesures (CIPM), meeting 26—28 September 1989 at the Bureau International des Poids et Mesures (BIPM). The ITS-90 was recommended to the CIPM for its adoption following the completion of the final details of the new scale by the Comité Consultatif de Thermométrie (CCT), meeting 12—14 September 1989 at the BIPM in its 17th Session. The ITS-90 became the official international temperature scale on 1 January 1990. The ITS-90 supersedes the present scales, the International Practical Temperature Scale of 1968 (IPTS-68) and the 1976 Provisional 0.5 to 30 K Temperature Scale (EPT-76).

The ITS-90 extends upward from 0.65 K, and temperatures on this scale are in much better agreement with thermodynamic values that are those on the IPTS-68 and the EPT-76. The new scale has subranges and alternative definitions in certain ranges that greatly facilitate its use. Furthermore, its continuity, precision, and reproducibility throughout its ranges are much improved over that of the present scales. The replacement of the thermocouple with the platinum resistance thermometer at temperatures below 961.78°C resulted in the biggest improvement in reproducibility.

The ITS-90 is divided into four primary ranges:

1. Between 0.65 and 3.2 K, the ITS-90 is defined by the vapor pressure-temperature relation of ^3He , and between 1.25 and 2.1768 K (the λ point) and between 2.1768 and 5.0 K by the vapor pressure-temperature relations of ^4He . T_{90} is defined by the vapor pressure equations of the form:

$$T_{90}/\text{K} = A_0 + \sum_{i=1}^9 A_i \left[(\ln(p/\text{Pa}) - B)/C \right]^i$$

The values of the coefficients A_i , and of the constants A_0 , B , and C of the equations are given below.

2. Between 3.0 and 24.5561 K, the ITS-90 is defined in terms of a ^3He or ^4He constant volume gas thermometer (CVGT). The thermometer is calibrated at three temperatures — at the triple point of neon (24.5561 K), at the triple point of equilibrium hydrogen (13.8033 K), and at a temperature between 3.0 and 5.0 K, the value of which is determined by using either ^3He or ^4He vapor pressure thermometry.
3. Between 13.8033 K (−259.3467°C) and 1234.93 K (961.78°C), the ITS-90 is defined in terms of the specified fixed points given below, by resistance ratios of platinum resistance thermometers obtained by calibration at specified sets of the fixed points, and by reference functions and deviation functions of resistance ratios which relate to T_{90} between the fixed points.
4. Above 1234.93 K, the ITS-90 is defined in terms of Planck's radiation law, using the freezing-point temperature of either silver, gold, or copper as the reference temperature.

Full details of the calibration procedures and reference functions for various subranges are given in:

The International Temperature Scale of 1990, *Metrologia*, 27, 3, 1990; errata in *Metrologia*, 27, 107, 1990.

Defining Fixed Points of the ITS-90

Material ^a	Equilibrium state ^b	Temperature	
		T_{90} (K)	t_{90} (°C)
He	VP	3 to 5	−270.15 to −268.15
e-H ₂	TP	13.8033	−259.3467
e-H ₂ (or He)	VP (or CVGT)	≈17	≈−256.15
e-H ₂ (or He)	VP (or CVGT)	≈20.3	≈−252.85
Ne ^c	TP	24.5561	−248.5939
O ₂	TP	54.3584	−218.7916
Ar	TP	83.8058	−189.3442
Hg ^c	TP	234.3156	−38.8344
H ₂ O	TP	273.16	0.01
Ga ^c	MP	302.9146	29.7646
In ^c	FP	429.7485	156.5985
Sn	FP	505.078	231.928
Zn	FP	692.677	419.527
Al ^c	FP	933.473	660.323
Ag	FP	1234.93	961.78
Au	FP	1337.33	1064.18
Cu ^c	FP	1357.77	1084.62

INTERNATIONAL TEMPERATURE SCALE OF 1990 (ITS-90) (continued)

Defining Fixed Points of the ITS-90 (continued)

- ^a e-H₂ indicates equilibrium hydrogen, that is, hydrogen with the equilibrium distribution of its ortho and para states. Normal hydrogen at room temperature contains 25% para hydrogen and 75% ortho hydrogen.
- ^b VP indicates vapor pressure point; CVGT indicates constant volume gas thermometer point; TP indicates triple point (equilibrium temperature at which the solid, liquid, and vapor phases coexist); FP indicates freezing point, and MP indicates melting point (the equilibrium temperatures at which the solid and liquid phases coexist under a pressure of 101 325 Pa, one standard atmosphere). The isotopic composition is that naturally occurring.
- ^c Previously, these were secondary fixed points.

Values of Coefficients in the Vapor Pressure Equations for Helium

Coef.or constant	³ He 0.65—3.2 K	⁴ He 1.25—2.1768 K	⁴ He 2.1768—5.0 K

CONVERSION OF TEMPERATURES FROM THE 1948 AND 1968 SCALES TO ITS-90

This table gives temperature corrections from older scales to the current International Temperature Scale of 1990 (see the preceding table for details on ITS-90). The first part of the table may be used for converting Celsius temperatures in the range -180 to 4000°C from IPTS-68 or IPTS-48 to ITS-90. Within the accuracy of the corrections, the temperature in the first column may be identified with either t_{68} , t_{48} , or t_{90} . The second part of the table is designed for use at lower temperatures to convert values expressed in kelvins from EPT-76 or IPTS-68 to ITS-90.

The references give analytical equations for expressing these relations. Note that Reference 1 supersedes Reference 2 with respect to corrections in the 630 to 1064°C range.

1 SI base units

Table 1 gives the seven base quantities, assumed to be mutually independent, on which the SI is founded; and the names and symbols of their respective units, called ‘‘SI base units.’’ Definitions of the SI base units are given in Appendix A. The kelvin and its symbol K are also used to express the value of a temperature interval or a temperature difference.

Table 1. SI base units

Base quantity	SI base unit	
	Name	Symbol
length	meter	m
mass	kilogram	kg
time	second	s
electric current	ampere	A
thermodynamic temperature	kelvin	K
amount of substance	mole	mol
luminous intensity	candela	cd

2 SI derived units

Derived units are expressed algebraically in terms of base units or other derived units (including the radian and steradian which are the two supplementary units – see Sec. 3). The symbols for derived units are obtained by means of the mathematical operations of multiplication and division. For example, the derived unit for the derived quantity molar mass (mass divided by amount of substance) is the kilogram per mole, symbol kg/mol. Additional examples of derived units expressed in terms of SI base units are given in Table 2.

Table 2. Examples of SI derived units expressed in terms of SI base units

Derived quantity	SI derived unit	
	Name	Symbol
area	square meter	m ²
volume	cubic meter	m ³
speed, velocity	meter per second	m/s
acceleration	meter per second squared	m/s ²
wave number	reciprocal meter	m ⁻¹
mass density (density)	kilogram per cubic meter	kg/m ³
specific volume	cubic meter per kilogram	m ³ /kg
current density	ampere per square meter	A/m ²
magnetic field strength	ampere per meter	A/m
amount-of-substance concentration (concentration)	mole per cubic meter	mol/m ³
luminance	candela per square meter	cd/m ²

2.1 SI derived units with special names and symbols

Certain SI derived units have special names and symbols; these are given in Tables 3a and 3b. As discussed in Sec. 3, the radian and steradian, which are the two supplementary units, are included in Table 3a.

INTERNATIONAL SYSTEM OF UNITS (SI) (continued)

Table 3a. SI derived units with special names and symbols, including the radian and steradian

Derived quantity	SI derived unit			
	Special name	Special symbol	Expression in terms of other SI units	Expression in terms of SI base units
plane angle	radian	rad		$\text{m} \cdot \text{m}^{-1} = 1$
solid angle	steradian	sr		$\text{m}^2 \cdot \text{m}^{-2} = 1$
frequency	hertz	Hz		s^{-1}
force	newton	N		$\text{m} \cdot \text{kg} \cdot \text{s}^{-2}$
pressure, stress	pascal	Pa	N/m^2	$\text{m}^{-1} \cdot \text{kg} \cdot \text{s}^{-2}$
energy, work, quantity of heat	joule	J	$\text{N} \cdot \text{m}$	$\text{m}^2 \cdot \text{kg} \cdot \text{s}^{-2}$
power, radiant flux	watt	W	J/s	$\text{m}^2 \cdot \text{kg} \cdot \text{s}^{-3}$
electric charge, quantity of electricity	coulomb	C		$\text{s} \cdot \text{A}$
electric potential, potential difference, electromotive force	volt	V	W/A	$\text{m}^2 \cdot \text{kg} \cdot \text{s}^{-3} \cdot \text{A}^{-1}$
capacitance	farad	F	C/V	$\text{m}^{-2} \cdot \text{kg}^{-1} \cdot \text{s}^4 \cdot \text{A}^2$
electric resistance	ohm	Ω	V/A	$\text{m}^2 \cdot \text{kg} \cdot \text{s}^{-3} \cdot \text{A}^{-2}$
electric conductance	siemens	S	A/V	$\text{m}^{-2} \cdot \text{kg}^{-1} \cdot \text{s}^3 \cdot \text{A}^2$
magnetic flux	weber	Wb	$\text{V} \cdot \text{s}$	$\text{m}^2 \cdot \text{kg} \cdot \text{s}^{-2} \cdot \text{A}^{-1}$
magnetic flux density	tesla	T	Wb/m^2	$\text{kg} \cdot \text{s}^{-2} \cdot \text{A}^{-1}$
inductance	henry	H	Wb/A	$\text{m}^2 \cdot \text{kg} \cdot \text{s}^{-2} \cdot \text{A}^{-2}$
Celsius temperature ^(a)	degree Celsius	°C		K
luminous flux	lumen	lm	$\text{cd} \cdot \text{sr}$	$\text{cd} \cdot \text{sr}^{(b)}$
illuminance	lux	lx	lm/m^2	$\text{m}^{-2} \cdot \text{cd} \cdot \text{sr}^{(b)}$

^(a) See Sec. 2.1.1.1.

^(b) The steradian (sr) is not an SI base unit. However, in photometry the steradian (sr) is maintained in expressions for units (see Sec. 3).

Table 3b. SI derived units with special names and symbols admitted for reasons of safeguarding human health^(a)

Derived quantity	SI derived unit			
	Special name	Special symbol	Expression in terms of other SI units	Expression in terms of SI base units
activity (of a radionuclide)	becquerel	Bq		s^{-1}
absorbed dose, specific energy (imparted), kerma	gray	Gy	J/kg	$\text{m}^2 \cdot \text{s}^{-2}$
dose equivalent, ambient dose equivalent, directional dose equivalent, personal dose equivalent, equivalent dose	sievert	Sv	J/kg	$\text{m}^2 \cdot \text{s}^{-2}$

^(a) The derived quantities to be expressed in the gray and the sievert have been revised in accordance with the recommendations of the International Commission on Radiation Units and Measurements (ICRU).

2.1.1 Degree Celsius In addition to the quantity thermodynamic temperature (symbol T), expressed in the unit kelvin, use is also made of the quantity Celsius temperature (symbol t) defined by the equation

$$t = T - T_0 ,$$

where $T_0 = 273.15 \text{ K}$ by definition. To express Celsius temperature, the unit degree Celsius, symbol °C, which is equal in magnitude to the unit kelvin, is used; in this case, "degree Celsius" is a special name used in place of "kelvin." An interval or difference of Celsius temperature can, however, be expressed in the unit kelvin as well as in the unit degree Celsius. (Note that the thermodynamic temperature T_0 is exactly 0.01 K below the thermodynamic temperature of the triple point of water.)

2.2 Use of SI derived units with special names and symbols

Examples of SI derived units that can be expressed with the aid of SI derived units having special names and symbols (including the radian and steradian) are given in Table 4.

Table 4. Examples of SI derived units expressed with the aid of SI derived units having special names and symbols

Derived quantity	SI derived unit		
	Name	Symbol	Expression in terms of SI base units
angular velocity	radian per second	rad/s	$\text{m} \cdot \text{m}^{-1} \cdot \text{s}^{-1} = \text{s}^{-1}$
angular acceleration	radian per second squared	rad/s ²	$\text{m} \cdot \text{m}^{-1} \cdot \text{s}^{-2} = \text{s}^{-2}$
dynamic viscosity	pascal second	Pa · s	$\text{m}^{-1} \cdot \text{kg} \cdot \text{s}^{-1}$
moment of force	newton meter	N · m	$\text{m}^2 \cdot \text{kg} \cdot \text{s}^{-2}$
surface tension	newton per meter	N/m	$\text{kg} \cdot \text{s}^{-2}$
heat flux density, irradiance	watt per square meter	W/m ²	$\text{kg} \cdot \text{s}^{-3}$
radiant intensity	watt per steradian	W/sr	$\text{m}^2 \cdot \text{kg} \cdot \text{s}^{-3} \cdot \text{sr}^{-1}$ ^(a)
radiance	watt per square meter steradian	W/(m ² · sr)	$\text{kg} \cdot \text{s}^{-3} \cdot \text{sr}^{-1}$ ^(a)
heat capacity, entropy	joule per kelvin	J/K	$\text{m}^2 \cdot \text{kg} \cdot \text{s}^{-2} \cdot \text{K}^{-1}$
specific heat capacity, specific entropy	joule per kilogram kelvin	J/(kg · K)	$\text{m}^2 \cdot \text{s}^{-2} \cdot \text{K}^{-1}$
specific energy	joule per kilogram	J/kg	$\text{m}^2 \cdot \text{s}^{-2}$
thermal conductivity	watt per meter kelvin	W/(m · K)	$\text{m} \cdot \text{kg} \cdot \text{s}^{-3} \cdot \text{K}^{-1}$
energy density	joule per cubic meter	J/m ³	$\text{m}^{-1} \cdot \text{kg} \cdot \text{s}^{-2}$
electric field strength	volt per meter	V/m	$\text{m} \cdot \text{kg} \cdot \text{s}^{-3} \cdot \text{A}^{-1}$
electric charge density	coulomb per cubic meter	C/m ³	$\text{m}^{-3} \cdot \text{s} \cdot \text{A}$
electric flux density	coulomb per square meter	C/m ²	$\text{m}^{-2} \cdot \text{s} \cdot \text{A}$
permittivity	farad per meter	F/m	$\text{m}^{-3} \cdot \text{kg}^{-1} \cdot \text{s}^4 \cdot \text{A}^2$
permeability	henry per meter	H/m	$\text{m} \cdot \text{kg} \cdot \text{s}^{-2} \cdot \text{A}^{-2}$
molar energy	joule per mole	J/mol	$\text{m}^2 \cdot \text{kg} \cdot \text{s}^{-2} \cdot \text{mol}^{-1}$
molar entropy, molar heat capacity	joule per mole kelvin	J/(mol · K)	$\text{m}^2 \cdot \text{kg} \cdot \text{s}^{-2} \cdot \text{K}^{-1} \cdot \text{mol}^{-1}$
exposure (x and γ rays)	coulomb per kilogram	C/kg	$\text{kg}^{-1} \cdot \text{s} \cdot \text{A}$
absorbed dose rate	gray per second	Gy/s	$\text{m}^2 \cdot \text{s}^{-3}$

^(a) The steradian (sr) is not an SI base unit. However, in radiometry the steradian (sr) is maintained in expressions for units (see Sec. 3).

The advantages of using the special names and symbols of SI derived units are apparent in Table 4. Consider, for example, the quantity molar entropy: the unit J/(mol · K) is obviously more easily understood than its SI base-unit equivalent, $\text{m}^2 \cdot \text{kg} \cdot \text{s}^{-2} \cdot \text{K}^{-1} \cdot \text{mol}^{-1}$. Nevertheless, it should always be recognized that the special names and symbols exist for convenience; either the form in which special names or symbols are used for certain combinations of units or the form in which they are not used is correct. For example, because of the descriptive value implicit in the compound-unit form, communication is sometimes facilitated if magnetic flux (see Table 3a) is expressed in terms of the volt second (V · s) instead of the weber (Wb).

Tables 3a, 3b, and 4 also show that the values of several different quantities are expressed in the same SI unit. For example, the joule per kelvin (J/K) is the SI unit for heat capacity as well as for entropy. Thus the name of the unit is not sufficient to define the quantity measured.

A derived unit can often be expressed in several different ways through the use of base units and derived units with special names. In practice, with certain quantities, preference is given to using certain units with special names, or combinations of units, to facilitate the distinction between quantities whose values have identical expressions in terms of SI base units. For example, the SI unit of frequency is specified as the hertz (Hz) rather than the reciprocal second (s^{-1}), and the SI unit of moment of force is specified as the newton meter (N · m) rather than the joule (J).

Similarly, in the field of ionizing radiation, the SI unit of activity is designated as the becquerel (Bq) rather than the reciprocal second (s^{-1}), and the SI units of absorbed dose and dose equivalent are designated as the gray (Gy) and the sievert (Sv), respectively, rather than the joule per kilogram (J/kg).

3 SI supplementary units

As previously stated, there are two units in this class: the radian, symbol rad, the SI unit of the quantity plane angle; and the steradian, symbol sr, the SI unit of the quantity solid angle. Definitions of these units are given in Appendix A.

The SI supplementary units are now interpreted as so-called dimensionless derived units for which the CGPM allows the freedom of using or not using them in expressions for SI derived units.³ Thus the radian and steradian are not given in a separate table but have been included in Table 3a together with other derived units with special names and symbols (see Sec. 2.1). This interpretation of the supplementary units implies that plane angle and solid angle are considered derived quantities of dimension one (so-called dimensionless quantities), each of which has the unit one, symbol 1, as its coherent SI unit. However, in practice, when one expresses the values of derived quantities involving plane angle or solid angle, it often aids understanding if the special names (or symbols) "radian" (rad) or "steradian" (sr) are used in place of the number 1. For example, although values of the derived quantity angular velocity (plane angle divided by time) may be expressed in the unit s^{-1} , such values are usually expressed in the unit rad/s.

Because the radian and steradian are now viewed as so-called dimensionless derived units, the Consultative Committee for Units (CCU, *Comité Consultatif des Unités*) of the CIPM as result of a 1993 request it received from ISO/TC12, recommended to the CIPM that it request the CGPM to abolish the class of supplementary units as a separate class in the SI. The CIPM accepted the CCU recommendation, and if the abolishment is approved by the CGPM as is likely (the question will be on the agenda of the 20th CGPM, October 1995), the SI will consist of only two classes of units: base units and derived units, with the radian and steradian subsumed into the class of derived units of the SI. (The option of using or not using them in expressions for SI derived units, as is convenient, would remain unchanged.)

4 Decimal multiples and submultiples of SI units: SI prefixes

Table 5 gives the SI prefixes that are used to form decimal multiples and submultiples of SI units. They allow very large or very small numerical values to be avoided. A prefix attaches directly to the name of a unit, and a prefix symbol attaches directly to the symbol for a unit. For example, one kilometer, symbol 1 km, is equal to one thousand meters, symbol 1000 m or 10^3 m. When prefixes are attached to SI units, the units so formed are called "multiples and submultiples of SI units" in order to distinguish them from the coherent system of SI units.

Note: Alternative definitions of the SI prefixes and their symbols are not permitted. For example, it is unacceptable to use kilo (k) to represent $2^{10} = 1024$, mega (M) to represent $2^{20} = 1\,048\,576$, or giga (G) to represent $2^{30} = 1\,073\,741\,824$.

³ This interpretation was given in 1980 by the CIPM. It was deemed necessary because Resolution 12 of the 11th CGPM, which established the SI in 1960, did not specify the nature of the supplementary units. The interpretation is based on two principal considerations: that plane angle is generally expressed as the ratio of two lengths and solid angle as the ratio of an area and the square of a length, and are thus quantities of dimension one (so-called dimensionless quantities); and that treating the radian and steradian as SI base units – a possibility not disallowed by Resolution 12 – could compromise the internal coherence of the SI based on only seven base units. (See ISO 31-0 for a discussion of the concept of dimension.)

Table 5. SI prefixes

Factor	Prefix	Symbol	Factor	Prefix	Symbol
$10^{24} = (10^3)^8$	yotta	Y	10^{-1}	deci	d
$10^{21} = (10^3)^7$	zetta	Z	10^{-2}	centi	c
$10^{18} = (10^3)^6$	exa	E	$10^{-3} = (10^3)^{-1}$	milli	m
$10^{15} = (10^3)^5$	peta	P	$10^{-6} = (10^3)^{-2}$	micro	μ
$10^{12} = (10^3)^4$	tera	T	$10^{-9} = (10^3)^{-3}$	nano	n
$10^9 = (10^3)^3$	giga	G	$10^{-12} = (10^3)^{-4}$	pico	p
$10^6 = (10^3)^2$	mega	M	$10^{-15} = (10^3)^{-5}$	femto	f
$10^3 = (10^3)^1$	kilo	k	$10^{-18} = (10^3)^{-6}$	atto	a
10^2	hecto	h	$10^{-21} = (10^3)^{-7}$	zepto	z
10^1	deka	da	$10^{-24} = (10^3)^{-8}$	yocto	y

5 Units Outside the SI

Units that are outside the SI may be divided into three categories:

- those units that are accepted for use with the SI;
- those units that are temporarily accepted for use with the SI; and
- those units that are not accepted for use with the SI and thus must strictly be avoided.

5.1 Units accepted for use with the SI

The following sections discuss in detail the units that are acceptable for use with the SI.

5.1.1 Hour, degree, liter, and the like

Certain units that are not part of the SI are essential and used so widely that they are accepted by the CIPM for use with the SI. These units are given in Table 6. The combination of units of this table with SI units to form derived units should be restricted to special cases in order not to lose the advantages of the coherence of SI units.

Additionally, it is recognized that it may be necessary on occasion to use time-related units other than those given in Table 6; in particular, circumstances may require that intervals of time be expressed in weeks, months, or years. In such cases, if a standardized symbol for the unit is not available, the name of the unit should be written out in full.

Table 6. Units accepted for use with the SI

Name	Symbol	Value in SI units
minute	min	1 min = 60 s
hour	h	1 h = 60 min = 3600 s
day	d	1 d = 24 h = 86 400 s
degree	$^{\circ}$	$1^{\circ} = (\pi/180)$ rad
minute	'	$1' = (1/60)^{\circ} = (\pi/10\,800)$ rad
second	"	$1'' = (1/60)' = (\pi/648\,000)$ rad
liter	l, L ^(b)	1 L = 1 dm ³ = 10 ⁻³ m ³
metric ton ^(c)	t	1 t = 10 ³ kg

^(b) The alternative symbol for the liter, L, was adopted by the CGPM in order to avoid the risk of confusion between the letter l and the number 1. Thus, although both l and L are internationally accepted symbols for the liter, to avoid this risk the symbol to be used in the United States is L. The script letter ℓ is not an approved symbol for the liter.

^(c) This is the name to be used for this unit in the United States; it is also used in some other English-speaking countries. However, "tonne" is used in many countries.

5.1.2 Neper, bel, shannon, and the like

There are a few highly specialized units not listed in Table 6 that are given by the International Organization for Standardization (ISO) or the International Electrotechnical Commission (IEC) and which are also acceptable for use with the SI. They include the neper (Np), bel (B), octave, phon, and sone, and units used in information technology, including the baud (Bd), bit (bit), erlang (E), hartley (Hart), and shannon (Sh)⁴. It is the position of NIST that the only such additional units that may be used with the SI are those given in either the International Standards on quantities and units of ISO or of IEC.

5.1.3 Electronvolt and unified atomic mass unit

The CIPM also finds it necessary to accept for use with the SI the two units given in Table 7. These units are used in specialized fields; their values in SI units must be obtained from experiment and, therefore, are not known exactly.

Note: In some fields the unified atomic mass unit is called the dalton, symbol Da; however, this name and symbol are not accepted by the CGPM, CIPM, ISO, or IEC for use with the SI. Similarly, AMU is not an acceptable unit symbol for the unified atomic mass unit. The only allowed name is "unified atomic mass unit" and the only allowed symbol is u.

Table 7. Units accepted for use with the SI whose values in SI units are obtained experimentally

Name	Symbol	Definition
electronvolt	eV	^(a)
unified atomic mass unit	u	^(b)

^(a) The electronvolt is the kinetic energy acquired by an electron in passing through a potential difference of 1 V in vacuum; $1 \text{ eV} = 1.602\,177\,33 \times 10^{-19} \text{ J}$ with a combined standard uncertainty of $0.000\,000\,49 \times 10^{-19} \text{ J}$.

^(b) The unified atomic mass unit is equal to 1/12 of the mass of an atom of the nuclide ¹²C; $1 \text{ u} = 1.660\,540\,2 \times 10^{-27} \text{ kg}$ with a combined standard uncertainty of $0.000\,001\,0 \times 10^{-27} \text{ kg}$.

5.1.4 Natural and atomic units

In some cases, particularly in basic science, the values of quantities are expressed in terms of fundamental constants of nature or so-called natural units. The use of these units with the SI is permissible when it is necessary for the most effective communication of information. In such cases, the specific natural units that are used must be identified. This requirement applies even to the system of units customarily called "atomic units" used in theoretical atomic physics and chemistry, inasmuch as there are several different systems that have the appellation "atomic units." Examples of physical quantities used as natural units are given in Table 8.

NIST also takes the position that while theoretical results intended primarily for other theorists may be left in natural units, if they are also intended for experimentalists, they must also be given in acceptable units.

⁴ The symbol in parentheses following the name of the unit is its internationally accepted unit symbol, but the octave, phon, and sone have no such unit symbols. For additional information on the neper and bel, see Sec. 0.5 of ISO 31-2. The question of the byte (B) is under international consideration.

Table 8. Examples of physical quantities sometimes used as natural units

Kind of quantity	Physical quantity used as a unit	Symbol
action	Planck constant divided by 2π	\hbar
electric charge	elementary charge	e
energy	Hartree energy	E_h
length	Bohr radius	a_0
length	Compton wavelength (electron)	λ_C
magnetic flux	magnetic flux quantum	Φ_0
magnetic moment	Bohr magneton	μ_B
magnetic moment	nuclear magneton	μ_N
mass	electron rest mass	m_e
mass	proton rest mass	m_p
speed	speed of electromagnetic waves in vacuum	c

5.2 Units temporarily accepted for use with the SI

Because of existing practice in certain fields or countries, in 1978 the CIPM considered that it was permissible for the units given in Table 9 to continue to be used with the SI until the CIPM considers that their use is no longer necessary. However, these units must not be introduced where they are not presently used. Further, NIST strongly discourages the continued use of these units except for the nautical mile, knot, are, and hectare; and except for the curie, roentgen, rad, and rem until the year 2000 (the cessation date suggested by the Committee for Interagency Radiation Research and Policy Coordination or CIRRPC, a United States Government interagency group).⁵

Table 9. Units temporarily accepted for use with the SI^(a)

Name	Symbol	Value in SI units
nautical mile		1 nautical mile = 1852 m
knot		1 nautical mile per hour = (1852/3600) m/s
ångström	Å	1 Å = 0.1 nm = 10^{-10} m
are ^(b)	a	1 a = 1 dam ² = 10^2 m ²
hectare ^(b)	ha	1 ha = 1 hm ² = 10^4 m ²
barn	b	1 b = 100 fm ² = 10^{-28} m ²
bar	bar	1 bar = 0.1 MPa = 100 kPa = 1000 hPa = 10^5 Pa
gal	Gal	1 Gal = 1 cm/s ² = 10^{-2} m/s ²
curie	Ci	1 Ci = 3.7×10^{10} Bq
roentgen	R	1 R = 2.58×10^{-4} C/kg
rad	rad ^(c)	1 rad = 1 cGy = 10^{-2} Gy
rem	rem	1 rem = 1 cSv = 10^{-2} Sv

^(a) See Sec. 5.2 regarding the continued use of these units.

^(b) This unit and its symbol are used to express agrarian areas.

^(c) When there is risk of confusion with the symbol for the radian, rd may be used as the symbol for rad.

⁵ In 1993 the CCU (see Sec. 3) was requested by ISO/TC 12 to consider asking the CIPM to deprecate the use of the units of Table 9 except for the nautical mile and knot, and possibly the are and hectare. The CCU discussed this request at its February 1995 meeting.

Appendix A. Definitions of the SI Base Units and the Radian and Steradian

A.1 Introduction

The following definitions of the SI base units are taken from NIST SP 330; the definitions of the SI supplementary units, the radian and steradian, which are now interpreted as SI derived units (see Sec. 3), are those generally accepted and are the same as those given in ANSI/IEEE Std 268-1992.

SI derived units are uniquely defined only in terms of SI base units; for example, $1 \text{ V} = 1 \text{ m}^2 \cdot \text{kg} \cdot \text{s}^{-3} \cdot \text{A}^{-1}$.

A.2 Meter (17th CGPM, 1983)

The meter is the length of the path travelled by light in vacuum during a time interval of $1/299\,792\,458$ of a second.

A.3 Kilogram (3d CGPM, 1901)

The kilogram is the unit of mass; it is equal to the mass of the international prototype of the kilogram.

A.4 Second (13th CGPM, 1967)

The second is the duration of $9\,192\,631\,770$ periods of the radiation corresponding to the transition between the two hyperfine levels of the ground state of the cesium-133 atom.

A.5 Ampere (9th CGPM, 1948)

The ampere is that constant current which, if maintained in two straight parallel conductors of infinite length, of negligible circular cross section, and placed 1 meter apart in vacuum, would produce between these conductors a force equal to 2×10^{-7} newton per meter of length.

A.6 Kelvin (13th CGPM, 1967)

The kelvin, unit of thermodynamic temperature, is the fraction $1/273.16$ of the thermodynamic temperature of the triple point of water.

A.7 Mole (14th CGPM, 1971)

1. *The mole is the amount of substance of a system which contains as many elementary entities as there are atoms in 0.012 kilogram of carbon 12.*

2. *When the mole is used, the elementary entities must be specified and may be atoms, molecules, ions, electrons, other particles, or specified groups of such particles.*

In the definition of the mole, it is understood that unbound atoms of carbon 12, at rest and in their ground state, are referred to.

Note that this definition specifies at the same time the nature of the quantity whose unit is the mole.

A.8 Candela (16th CGPM, 1979)

The candela is the luminous intensity, in a given direction, of a source that emits monochromatic radiation of frequency 540×10^{12} hertz and that has a radiant intensity in that direction of $(1/683)$ watt per steradian.

A.9 Radian

The radian is the plane angle between two radii of a circle that cut off on the circumference an arc equal in length to the radius.

A.10 Steradian

The steradian is the solid angle that, having its vertex in the center of a sphere, cuts off an area of the surface of the sphere equal to that of a square with sides of length equal to the radius of the sphere.

CONVERSION FACTORS

The following table gives conversion factors from various units of measure to SI units. It is reproduced from NIST Special Publication 811, *Guide for the Use of the International System of Units (SI)*. The table gives the factor by which a quantity expressed in a non-SI unit should be multiplied in order to calculate its value in the SI. The SI values are expressed in terms of the base, supplementary, and derived units of SI in order to provide a coherent presentation of the conversion factors and facilitate computations (see the table "International System of Units" in this Section). If desired, powers of ten can be avoided by using SI Prefixes and shifting the decimal point if necessary.

Conversion from a non-SI unit to a different non-SI unit may be carried out by using this table in two stages, e.g.,

$$1 \text{ cal}_{\text{th}} = 4.184 \text{ J}$$
$$1 \text{ Btu}_{\text{T}} = 1.055056 \text{ E}+03 \text{ J}$$

Thus,

$$1 \text{ Btu}_{\text{T}} = (1.055056 \text{ E}+03 \div 4.184) \text{ cal}_{\text{th}} = 252.164 \text{ cal}_{\text{th}}$$

Conversion factors are presented for ready adaptation to computer readout and electronic data transmission. The factors are written as a number equal to or greater than one and less than ten with six or fewer decimal places. This number is followed by the letter E (for exponent), a plus or a minus sign, and two digits which indicate the power of 10 by which the number must be multiplied to obtain the correct value. For example:

$$3.523 \ 907 \ \text{E}-02 \text{ is } 3.523 \ 907 \times 10^{-2}$$

or

$$0.035 \ 239 \ 07$$

Similarly:

$$3.386 \ 389 \ \text{E}+03 \text{ is } 3.386 \ 389 \times 10^3$$

or

$$3 \ 386.389$$

A factor in boldface is exact; i.e., all subsequent digits are zero. All other conversion factors have been rounded to the figures given in accordance with accepted practice. Where less than six digits after the decimal point are shown, more precision is not warranted.

It is often desirable to round a number obtained from a conversion of units in order to retain information on the precision of the value. The following rounding rules may be followed:

(1) If the digits to be discarded begin with a digit less than 5, the digit preceding the first discarded digit is not changed.

Example: 6.974 951 5 rounded to 3 digits is 6.97

(2) If the digits to be discarded begin with a digit greater than 5, the digit preceding the first discarded digit is increased by one.

Example: 6.974 951 5 rounded to 4 digits is 6.975

(3) If the digits to be discarded begin with a 5 and at least one of the following digits is greater than 0, the digit preceding the 5 is increased by 1.

Example: 6.974 851 rounded to 5 digits is 6.974 9

(4) If the digits to be discarded begin with a 5 and all of the following digits are 0, the digit preceding the 5 is unchanged if it is even and increased by one if it is odd. (Note that this means that the final digit is always even.)

Examples: 6.974 951 5 rounded to 7 digits is 6.974 952

6.974 950 5 rounded to 7 digits is 6.974 950

⁹ The U.S. survey foot equals (1200/3937) m. 1 international foot = 0.999998 survey foot.

¹⁰ One technical atmosphere equals one kilogram-force per square centimeter (1 at = 1 kgf/cm²).

¹¹ The Fifth International Conference on the Properties of Steam (London, July 1956) defined the International Table calorie as 4.1868 J. Therefore the exact conversion factor for the International Table Btu is 1.055 055 852 62 kJ. Note that the notation for International Table used in this listing is subscript "IT". Similarly, the notation for thermochemical is subscript "th." Further, the thermochemical Btu, Btu_{th}, is based on the thermochemical calorie, cal_{th}, where cal_{th} = 4.184 J exactly.

¹² The kilogram calorie or "large calorie" is an obsolete term used for the kilocalorie, which is the calorie used to express the energy content of foods. However, in practice, the prefix "kilo" is usually omitted.

¹³ Conversion factors for mercury manometer pressure units are calculated using the standard value for the acceleration of gravity and the density of mercury at the stated temperature. Additional digits are not justified because the definitions of the units do not take into account the compressibility of mercury or the change in density caused by the revised practical temperature scale, ITS-90. Similar comments also apply to water manometer pressure units. Conversion factors for conventional mercury and water manometer pressure units are based on ISO 31-3.

¹⁸ The exact conversion factor is 10⁴/π.

¹⁹ This conversion factor is based on 1 d = 86 400 s; and 1 Julian century = 36 525 d. (See *The Astronomical Almanac for the Year 1995*, page K6, U.S. Government Printing Office, Washington, DC, 1994).

²⁰ In 1964 the General Conference on Weights and Measures reestablished the name “liter” as a special name for the cubic decimeter. Between 1901 and 1964 the liter was slightly larger (1.000 028 dm³); when one uses high-accuracy volume data of that time, this fact must be kept in mind.

²¹ The value of this unit, 1 nautical mile = 1852 m, was adopted by the First International Extraordinary Hydrographic Conference, Monaco, 1929, under the name “International nautical mile.”

²² For converting fuel economy, as used in the U.S., to fuel consumption.

²⁵ The therm (EC) is legally defined in the Council Directive of 20 December 1979, Council of the European Communities (now the European Union, EU). The therm (U.S.) is legally defined in the Federal Register of July 27, 1968. Although the therm (EC), which is based on the International Table Btu, is frequently used by engineers in the United States, the therm (U.S.) is the legal unit used by the U.S. natural gas industry.

²⁶ Defined (not measured) value.

CONVERSION OF TEMPERATURES

From	To	
Celsius	Fahrenheit	$t_F/^{\circ}\text{F} = (9/5) t/^{\circ}\text{C} + 32$
	Kelvin	$T/\text{K} = t/^{\circ}\text{C} + 273.15$
	Rankine	$T/^{\circ}\text{R} = (9/5) (t/^{\circ}\text{C} + 273.15)$
Fahrenheit	Celsius	$t/^{\circ}\text{C} = (5/9) [(t_F/^{\circ}\text{F}) - 32]$
	Kelvin	$T/\text{K} = (5/9) [(t_F/^{\circ}\text{F}) - 32] + 273.15$
	Rankine	$T/^{\circ}\text{R} = t_F/^{\circ}\text{F} + 459.67$
Kelvin	Celsius	$t/^{\circ}\text{C} = T/\text{K} - 273.15$
	Rankine	$T/^{\circ}\text{R} = (9/5) T/\text{K}$
Rankine	Fahrenheit	$t_F/^{\circ}\text{F} = T/^{\circ}\text{R} - 459.67$
	Kelvin	$T/\text{K} = (5/9) T/^{\circ}\text{R}$

Definition of symbols:

T = thermodynamic (absolute) temperature

t = Celsius temperature (the symbol q is also used for Celsius temperature)

t_F = Fahrenheit temperature

DESIGNATION OF LARGE NUMBERS

	U.S.A.	Other Countries
10^6	million	million
10^9	billion	milliard
10^{12}	trillion	billion
10^{15}	quadrillion	billiard
10^{18}	quintillion	trillion
10^{100}	googol	
10^{googol}	googolplex	

CONVERSION FACTORS FOR ENERGY UNITS

If greater accuracy is required, use the *Energy Equivalents* section of the *Fundamental Physical Constants* table.

	Wavenumber $\bar{\nu}$ cm ⁻¹	Frequency ν MHz	Energy E aJ	Energy E eV	Energy E E_h	Molar energy E_m kJ/mol	Molar energy E_m kcal/mol	Temperature T K
$\bar{\nu}$: 1 cm ⁻¹	≐ 1	2.997925×10^4	1.986447×10^{-5}	1.239842×10^{-4}	4.556335×10^{-6}	11.96266×10^{-3}	2.85914×10^{-3}	1.438769
ν : 1 MHz	≐ 3.33564×10^{-5}	1	6.626076×10^{-10}	4.135669×10^{-9}	1.519830×10^{-10}	3.990313×10^{-7}	9.53708×10^{-8}	4.79922×10^{-5}
1 aJ	≐ 50341.1	1.509189×10^9	1	6.241506	0.2293710	602.2137	143.9325	7.24292×10^4
E : 1 eV	≐ 8065.54	2.417988×10^8	0.1602177	1	3.674931×10^{-2}	96.4853	23.0605	1.16045×10^4
E_h	≐ 219474.63	6.579684×10^9	4.359748	27.2114	1	2625.500	627.510	3.15773×10^5
E_m : 1 kJ/mol	≐ 83.5935	2.506069×10^6	1.660540×10^{-3}	1.036427×10^{-2}	3.808798×10^{-4}	1	0.239006	120.272
1 kcal/mol	≐ 349.755	1.048539×10^7	6.947700×10^{-3}	4.336411×10^{-2}	1.593601×10^{-3}	4.184	1	503.217
T : 1 K	≐ 0.695039	2.08367×10^4	1.380658×10^{-5}	8.61738×10^{-5}	3.16683×10^{-6}	8.31451×10^{-3}	1.98722×10^{-3}	1

Examples of the use of this table: 1 aJ ≐ 50341 cm⁻¹
1 eV ≐ 96.4853 kJ mol⁻¹

The symbol ≐ should be read as meaning “corresponds to” or “is equivalent to”.
 $E = h\nu = hc\bar{\nu} = kT$; $E_m = N_A E$; E_h is the Hartree energy

CONVERSION FACTORS FOR PRESSURE UNITS

	Pa	kPa	MPa	bar	atmos	Torr	μmHg	psi
Pa	1	0.001	0.000001	0.00001	9.8692×10^{-6}	0.0075006	7.5006	0.0001450377

psi	6894.757	6.894757	0.006894757	0.06894757	0.068046	51.7151	51715.1	1

To convert a pressure value from a unit in the left hand column to a new unit, multiply the value by the factor appearing in the column for the new unit. For example:

$$1 \text{ kPa} = 9.8692 \times 10^{-3} \text{ atmos}$$

$$1 \text{ Torr} = 1.33322 \times 10^{-4} \text{ MPa}$$

Notes: μmHg is often referred to as “micron”

Torr is essentially identical to mmHg

psi is an abbreviation for the unit pound–force per square inch

psia (as a term for a physical quantity) implies the true (absolute) pressure

psig implies the true pressure minus the local atmospheric pressure

VALUES OF THE GAS CONSTANT IN DIFFERENT UNIT SYSTEMS

In SI units the value of the gas constant, R , is:

$$\begin{aligned} R &= 8.314510 \text{ Pa m}^3 \text{ K}^{-1} \text{ mol}^{-1} \\ &= 8314.510 \text{ Pa L K}^{-1} \text{ mol}^{-1} \\ &= 0.08314510 \text{ bar L K}^{-1} \text{ mol}^{-1} \end{aligned}$$

This table gives the appropriate value of R for use in the ideal gas equation, $PV = nRT$, when the variables are expressed in other units. The following conversion factors for pressure units were used in generating the table:

$$\begin{aligned} 1 \text{ atm} &= 101325 \text{ Pa} \\ 1 \text{ psi} &= 6894.757 \text{ Pa} \\ 1 \text{ torr (mmHg)} &= 133.322 \text{ Pa [at } 0^\circ\text{C]} \\ 1 \text{ in Hg} &= 3386.38 \text{ Pa [at } 0^\circ\text{C]} \\ 1 \text{ in H}_2\text{O} &= 249.082 \text{ Pa [at } 4^\circ\text{C]} \\ 1 \text{ ft H}_2\text{O} &= 2988.98 \text{ Pa [at } 4^\circ\text{C]} \end{aligned}$$

The advice of Prabir K. Chandra is appreciated.

Demagnetization factor	D, N	dimensionless	$1/4\pi$	dimensionless

- a. Gaussian units and cgs emu are the same for magnetic properties. The defining relation is $B = H + 4\pi M$.
- b. Multiply a number in Gaussian units by C to convert it to SI (e.g., $1 \text{ G} \times 10^{-4} \text{ T/G} = 10^{-4} \text{ T}$).
- c. SI (*Système International d'Unités*) has been adopted by the National Bureau of Standards. Where two conversion factors are given, the upper one is recognized under, or consistent with, SI and is based on the definition $B = \mu_0(H + M)$, where $\mu_0 = 4\pi \times 10^{-7} \text{ H/m}$. The lower one is not recognized under SI and is based on the definition $B = \mu_0 H + J$, where the symbol I is often used in place of J .
- d. $1 \text{ gauss} = 10^5 \text{ gamma } (\gamma)$.
- e. Both oersted and gauss are expressed as $\text{cm}^{-1/2} \cdot \text{g}^{1/2} \cdot \text{s}^{-1}$ in terms of base units.
- f. A/m was often expressed as "ampere-turn per meter" when used for magnetic field strength.
- g. Magnetic moment per unit volume.
- h. The designation "emu" is not a unit.
- i. Recognized under SI, even though based on the definition $B = \mu_0 H + J$. See footnote c.
- j. $\mu_r = \mu/\mu_0 = 1 + \chi$, all in SI. μ_r is equal to Gaussian μ .
- k. $B \cdot H$ and $\mu_0 M \cdot H$ have SI units J/m³; $M \cdot H$ and $B \cdot H/4\pi$ have Gaussian units erg/cm³.

SYMBOLS AND TERMINOLOGY FOR PHYSICAL AND CHEMICAL QUANTITIES

The International Organization for Standardization (ISO), International Union of Pure and Applied Chemistry (IUPAC), and the International Union of Pure and Applied Physics (IUPAP) have jointly developed a set of recommended symbols for physical and chemical quantities. Consistent use of these recommended symbols helps assure unambiguous scientific communication. The list below is reprinted from Reference 1 with permission from IUPAC. Full details may be found in the following references:

1. Ian Mills, Ed., *Quantities, Units, and Symbols in Physical Chemistry*, Blackwell Scientific Publications, Oxford, 1988.
2. E. R. Cohen and P. Giacomo, *Symbols, Units, Nomenclature, and Fundamental Constants in Physics*, Document IUPAP-25, 1987; also published in *Physica*, 146A, 1–68, 1987.
3. *ISO Standards Handbook 2: Units of Measurement*, International Organization of Standardization, Geneva, 1982.

GENERAL RULES

The value of a physical quantity is expressed as the product of a numerical value and a unit, e.g.:

$$T = 300 \text{ K}$$

$$V = 26.2 \text{ cm}^3$$

$$C_p = 45.3 \text{ J mol}^{-1} \text{ K}^{-1}$$

The symbol for a physical quantity is always given in italic (sloping) type, while symbols for units are given in roman type. Column headings in tables and axis labels on graphs may conveniently be written as the physical quantity symbol divided by the unit symbol, e.g.:

$$T/\text{K}$$

$$V/\text{cm}^3$$

$$C_p/\text{J mol}^{-1} \text{ K}^{-1}$$

The values in the table or graph axis are then pure numbers.

Subscripts to symbols for physical quantities should be italic if the subscript refers to another physical quantity or to a number, e.g.:

$$C_p \text{ — heat capacity at constant pressure}$$

$$B_n \text{ — } n\text{th virial coefficient}$$

Subscripts which have other meanings should be in roman type:

$$m_p \text{ — mass of the proton}$$

$$E_k \text{ — kinetic energy}$$

The following tables give the recommended symbols for the major classes of physical and chemical quantities. The expression in the Definition column is given as an aid in identifying the quantity but is not necessarily the complete or unique definition. The SI Unit gives one (not necessarily unique) expression for the coherent SI unit for the quantity. Other equivalent unit expressions, including those which involve SI prefixes, may be used.

<i>Name</i>	<i>Symbol</i>	<i>Definition</i>	<i>SI unit</i>
SPACE AND TIME			
cartesian space coordinates	x, y, z		m
spherical polar coordinates	r, θ, ϕ		m, 1, 1
generalized coordinate	q, q_i		(varies)
position vector	\mathbf{r}	$\mathbf{r} = xi + yj + zk$	m
length	l		m
special symbols:

acceleration	$a, (g)$	$a = dv/dt$	m s^{-2}

CLASSICAL MECHANICS

mass	m		kg
reduced mass	μ	$\mu = m_1 m_2 / (m_1 + m_2)$	kg
density, mass density	ρ	$\rho = m/V$	kg m^{-3}
relative density	d	$d = \rho/\rho^\circ$	1
surface density	ρ_A, ρ_S	$\rho_A = m/A$	kg m^{-2}
specific volume	v	$v = V/m = 1/\rho$	$\text{m}^3 \text{kg}^{-1}$
momentum	p	$p = mv$	kg m s^{-1}
angular momentum, action	L	$L = r \times p$	J s
moment of inertia	I, J	$I = \sum m_i r_i^2$	kg m^2
force	F	$F = dp/dt = ma$	N
torque, moment of a force	$T, (M)$	$T = r \times F$	N m
energy	E		J
potential energy	E_p, V, Φ	$E_p = -\int F \cdot ds$	J
kinetic energy	E_k, T, K	$E_k = \frac{1}{2}mv^2$	J
work	W, w	$W = \int F \cdot ds$	J
Hamilton function	H	$H(q, p)$ $= T(q, p) + V(q)$	J
Lagrange function	L	$L(q, \dot{q})$ $= T(q, \dot{q}) - V(q)$	J

SYMBOLS AND TERMINOLOGY FOR PHYSICAL AND CHEMICAL QUANTITIES (continued)

<i>Name</i>	<i>Symbol</i>	<i>Definition</i>	<i>SI unit</i>
pressure	p, P	$p = F/A$	Pa, N m^{-2}
surface tension	γ, σ	$\gamma = dW/dA$	N m^{-1} , J m^{-2}
weight	$G, (W, P)$	$G = mg$	N
gravitational constant	G	$F = Gm_1 m_2/r^2$	$\text{N m}^2 \text{kg}^{-2}$
normal stress	σ	$\sigma = F/A$	Pa
shear stress	τ	$\tau = F/A$	Pa
linear strain,	ε, e	$\varepsilon = \Delta l/l$	1
relative elongation			
modulus of elasticity,	E	$E = \sigma/\varepsilon$	Pa
Young's modulus			
shear strain	γ	$\gamma = \Delta x/d$	1
shear modulus	G	$G = \tau/\gamma$	Pa
volume strain,	θ	$\theta = \Delta V/V_0$	1
bulk strain			
bulk modulus,	K	$K = -V_0(dp/dV)$	Pa
compression modulus			
viscosity,	η, μ	$\tau_{x,z} = \eta(dv_x/dz)$	Pa s
dynamic viscosity			
fluidity	ϕ	$\phi = 1/\eta$	$\text{m kg}^{-1} \text{s}$
kinematic viscosity	ν	$\nu = \eta/\rho$	$\text{m}^2 \text{s}^{-1}$
friction coefficient	$\mu, (f)$	$F_{\text{frict}} = \mu F_{\text{norm}}$	1
power	P	$P = dW/dt$	W
sound energy flux	P, P_a	$P = dE/dt$	W
acoustic factors,			
reflection factor	ρ	$\rho = P_r/P_0$	1
acoustic absorption	$\alpha_a, (\alpha)$	$\alpha_a = 1 - \rho$	1
factor			
transmission factor	τ	$\tau = P_{tr}/P_0$	1
dissipation factor	δ	$\delta = \alpha_a - \tau$	1
ELECTRICITY AND MAGNETISM			
quantity of electricity,	Q		C
electric charge			
charge density	ρ	$\rho = Q/V$	C m^{-3}
surface charge density	σ	$\sigma = Q/A$	C m^{-2}
electric potential	V, ϕ	$V = dW/dQ$	V, J C^{-1}
electric potential	$U, \Delta V, \Delta\phi$	$U = V_2 - V_1$	V
difference			
electromotive force	E	$E = \int (F/Q) \cdot ds$	V
electric field strength	E	$E = F/Q = -\text{grad } V$	V m^{-1}
electric flux	Ψ	$\Psi = \int D \cdot dA$	C
electric displacement	D	$D = \varepsilon E$	C m^{-2}
capacitance	C	$C = Q/U$	F, C V^{-1}
permittivity	ε	$D = \varepsilon E$	F m^{-1}

SYMBOLS AND TERMINOLOGY FOR PHYSICAL AND CHEMICAL QUANTITIES (continued)

Name	Symbol	Definition	SI unit
permittivity of vacuum	ϵ_0	$\epsilon_0 = \mu_0^{-1} c_0^{-2}$	F m^{-1}
relative permittivity	ϵ_r	$\epsilon_r = \epsilon/\epsilon_0$	1
dielectric polarization (dipole moment per volume)	P	$P = D - \epsilon_0 E$	C m^{-2}
electric susceptibility	χ_e	$\chi_e = \epsilon_r - 1$	1
electric dipole moment	p, μ	$p = Qr$	C m
electric current	I	$I = dQ/dt$	A
electric current density	j, J	$I = \int j \cdot dA$	A m^{-2}
magnetic flux density, magnetic induction	B	$F = Qv \times B$	T
magnetic flux	Φ	$\Phi = \int B \cdot dA$	Wb
magnetic field strength	H	$B = \mu H$	A m^{-1}
permeability	μ	$B = \mu H$	$\text{N A}^{-2}, \text{H m}^{-1}$
permeability of vacuum	μ_0		H m^{-1}
relative permeability	μ_r	$\mu_r = \mu/\mu_0$	1
magnetization (magnetic dipole moment per volume)	M	$M = B/\mu_0 - H$	A m^{-1}
magnetic susceptibility	$\chi, \kappa, (\chi_m)$	$\chi = \mu_r - 1$	1
molar magnetic susceptibility	χ_m	$\chi_m = V_m \chi$	$\text{m}^3 \text{mol}^{-1}$
magnetic dipole moment	m, μ	$E_p = -m \cdot B$	$\text{A m}^2, \text{J T}^{-1}$
electrical resistance	R	$R = U/I$	Ω
conductance	G	$G = 1/R$	S
loss angle	δ	$\delta = (\pi/2) + \phi_I - \phi_U$	1, rad
reactance	X	$X = (U/I) \sin \delta$	Ω
impedance (complex impedance)	Z	$Z = R + iX$	Ω
admittance (complex admittance)	Y	$Y = 1/Z$	S
susceptance	B	$Y = G + iB$	S
resistivity	ρ	$\rho = E/j$	Ωm
conductivity	κ, γ, σ	$\kappa = 1/\rho$	S m^{-1}
self-inductance	L	$E = -L(dI/dt)$	H
mutual inductance	M, L_{12}	$E_1 = L_{12}(dI_2/dt)$	H
magnetic vector potential	A	$B = \nabla \times A$	Wb m^{-1}
Poynting vector	S	$S = E \times H$	W m^{-2}
QUANTUM MECHANICS			
momentum operator	\hat{p}	$\hat{p} = -i\hbar\nabla$	$\text{m}^{-1} \text{J s}$
kinetic energy operator	\hat{T}	$\hat{T} = -(\hbar^2/2m)\nabla^2$	J

SYMBOLS AND TERMINOLOGY FOR PHYSICAL AND CHEMICAL QUANTITIES (continued)

Name	Symbol	Definition	SI unit
hamiltonian operator	\hat{H}	$\hat{H} = \hat{T} + V$	J
wavefunction, state function	Ψ, ψ, ϕ	$\hat{H}\psi = E\psi$	(m ^{-3/2})
probability density	P	$P = \psi^*\psi$	(m ⁻³)
charge density of electrons	ρ	$\rho = -eP$	(C m ⁻³)
probability current density	S	$S = -i\hbar(\psi^*\nabla\psi - \psi\nabla\psi^*)/2m_e$	(m ⁻² s ⁻¹)
electric current density of electrons	j	$j = -eS$	(A m ⁻²)
matrix element of operator \hat{A}	$A_{ij}, \langle i \hat{A} j\rangle$	$A_{ij} = \int \psi_i^* \hat{A} \psi_j d\tau$	(varies)
expectation value of operator \hat{A}	$\langle A \rangle, \bar{A}$	$\langle A \rangle = \int \psi^* \hat{A} \psi d\tau$	(varies)
hermitian conjugate of \hat{A}	\hat{A}^\dagger	$(\hat{A}^\dagger)_{ij} = (A_{ji})^*$	(varies)
commutator of \hat{A} and \hat{B}	$[\hat{A}, \hat{B}], [\hat{A}, \hat{B}]_-$	$[\hat{A}, \hat{B}] = \hat{A}\hat{B} - \hat{B}\hat{A}$	(varies)
anticommutator of \hat{A} and \hat{B}	$[\hat{A}, \hat{B}]_+$	$[\hat{A}, \hat{B}]_+ = \hat{A}\hat{B} + \hat{B}\hat{A}$	(varies)
spin wavefunction	$\alpha; \beta$		1
coulomb integral	H_{AA}	$H_{AA} = \int \psi_A^* \hat{H} \psi_A d\tau$	J
resonance integral	H_{AB}	$H_{AB} = \int \psi_A^* \hat{H} \psi_B d\tau$	J
overlap integral	S_{AB}	$S_{AB} = \int \psi_A^* \psi_B d\tau$	1
ATOMS AND MOLECULES			
nucleon number, mass number	A		1
proton number, atomic number	Z		1
neutron number	N	$N = A - Z$	1
electron rest mass	m_e		kg
mass of atom, atomic mass	m_a, m		kg
atomic mass constant	m_u	$m_u = m_a(^{12}\text{C})/12$	kg
mass excess	Δ	$\Delta = m_a - Am_u$	kg
elementary charge, proton charge	e		C
Planck constant	h		J s
Planck constant/ 2π	\hbar	$\hbar = h/2\pi$	J s
Bohr radius	a_0	$a_0 = 4\pi\epsilon_0\hbar^2/m_e e^2$	m
Hartree energy	E_h	$E_h = \hbar^2/m_e a_0^2$	J
Rydberg constant	R_∞	$R_\infty = E_h/2hc$	m ⁻¹
fine structure constant	α	$\alpha = e^2/4\pi\epsilon_0\hbar c$	1
ionization energy	E_i		J

SYMBOLS AND TERMINOLOGY FOR PHYSICAL AND CHEMICAL QUANTITIES (continued)

Name	Symbol	Definition	SI unit
electron affinity	E_{ea}		J
dissociation energy	E_d, D		J
from the ground state	D_0		J
from the potential minimum	D_e		J
principal quantum number (H atom)	n	$E = -hcR/n^2$	1
angular momentum quantum numbers	see under Spectroscopy		
magnetic dipole moment of a molecule	m, μ	$E_p = -m \cdot B$	$J T^{-1}$
magnetizability of a molecule	ξ	$m = \xi B$	$J T^{-2}$
Bohr magneton	μ_B	$\mu_B = e\hbar/2m_e$	$J T^{-1}$
nuclear magneton	μ_N	$\mu_N = (m_e/m_p)\mu_B$	$J T^{-1}$
magnetogyric ratio (gyromagnetic ratio)	γ	$\gamma = \mu/L$	$C kg^{-1}$
g factor	g		1
Larmor circular frequency	ω_L	$\omega_L = (e/2m)B$	s^{-1}
Larmor frequency	ν_L	$\nu_L = \omega_L/2\pi$	Hz
longitudinal relaxation time	T_1		s
transverse relaxation time	T_2		s
electric dipole moment of a molecule	p, μ	$E_p = -p \cdot E$	C m
quadrupole moment of a molecule	$Q; \Theta$	$E_p = \frac{1}{2}Q; V'' = \frac{1}{3}\Theta; V''$	$C m^2$
quadrupole moment of a nucleus	eQ	$eQ = 2\langle\Theta_{zz}\rangle$	$C m^2$
electric field gradient tensor	q	$q_{\alpha\beta} = -\partial^2 V/\partial\alpha\partial\beta$	$V m^{-2}$
quadrupole interaction energy tensor	χ	$\chi_{\alpha\beta} = eQq_{\alpha\beta}$	J
electric polarizability of a molecule	α	p (induced) = αE	$C m^2 V^{-1}$
activity (of a radioactive substance)	A	$A = -dN_B/dt$	Bq
decay (rate) constant, disintegration (rate) constant	λ	$A = \lambda N_B$	s^{-1}
half life	$t_{\frac{1}{2}}, T_{\frac{1}{2}}$		s
mean life	τ		s
level width	Γ	$\Gamma = \hbar/\tau$	J

SYMBOLS AND TERMINOLOGY FOR PHYSICAL AND CHEMICAL QUANTITIES (continued)

<i>Name</i>	<i>Symbol</i>	<i>Definition</i>	<i>SI unit</i>
disintegration energy	Q		J
cross section (of a nuclear reaction)	σ		m ²
SPECTROSCOPY			
total term	T	$T = E_{\text{tot}}/hc$	m ⁻¹
transition wavenumber	$\tilde{\nu}, (\nu)$	$\tilde{\nu} = T' - T''$	m ⁻¹
transition frequency	ν	$\nu = (E' - E'')/h$	Hz
electronic term	T_e	$T_e = E_e/hc$	m ⁻¹
vibrational term	G	$G = E_{\text{vib}}/hc$	m ⁻¹
rotational term	F	$F = E_{\text{rot}}/hc$	m ⁻¹
spin orbit coupling constant	A	$T_{\text{s.o.}} = A \langle \hat{L} \cdot \hat{S} \rangle$	m ⁻¹
principal moments of inertia	$I_A; I_B; I_C$	$I_A \leq I_B \leq I_C$	kg m ²
rotational constants, in wavenumber	$\tilde{A}; \tilde{B}; \tilde{C}$	$\tilde{A} = h/8\pi^2 c I_A$	m ⁻¹
in frequency	$A; B; C$	$A = h/8\pi^2 I_A$	Hz
inertial defect	Δ	$\Delta = I_C - I_A - I_B$	kg m ²
asymmetry parameter	κ	$\kappa = \frac{(2B - A - C)}{(A - C)}$	1
centrifugal distortion constants, S reduction	$D_J; D_{JK}; D_K; d_1; d_2$		m ⁻¹
A reduction	$\Delta_J; \Delta_{JK}; \Delta_K; \delta_J; \delta_K$		m ⁻¹
harmonic vibration wavenumber	$\omega_e; \omega_r$		m ⁻¹
vibrational anharmonicity constant	$\omega_e x_e; x_{rs}; g_{ll'}$		m ⁻¹
vibrational quantum numbers	$v_r; l_t$		1
Coriolis zeta constant	ζ_{rs}^a		1
angular momentum quantum numbers	see additional information below		
degeneracy, statistical weight	g, d, β		1
electric dipole moment of a molecule	p, μ	$E_p = -p \cdot E$	C m
transition dipole moment of a molecule	M, R	$M = \int \psi' p \psi'' d\tau$	C m
molecular geometry, interatomic distances, equilibrium distance	r_e		m
zero-point average distance	r_z		m
ground state distance	r_0		m

SYMBOLS AND TERMINOLOGY FOR PHYSICAL AND CHEMICAL QUANTITIES (continued)

Name	Symbol	Definition	SI unit	
substitution structure distance	r_s		m	
vibrational coordinates, internal coordinates	R_i, r_i, θ_j , etc.		(varies)	
symmetry coordinates	S_i		(varies)	
normal coordinates				
mass adjusted	Q_r		$\text{kg}^{\frac{1}{2}} \text{m}$	
dimensionless	q_r		1	
vibrational force constants, diatomic	$f, (k)$	$f = \partial^2 V / \partial r^2$	J m^{-2}	
polyatomic, internal coordinates	f_{ij}	$f_{ij} = \partial^2 V / \partial r_i \partial r_j$	(varies)	
symmetry coordinates	F_{ij}	$F_{ij} = \partial^2 V / \partial S_i \partial S_j$	(varies)	
dimensionless normal coordinates	$\phi_{rst...}$ $k_{rst...}$		m^{-1}	
nuclear magnetic resonance (NMR), magnetogyric ratio	γ	$\gamma = \mu / I \hbar$	C kg^{-1}	
shielding constant	σ_A	$B_A = (1 - \sigma_A) B$	1	
chemical shift, δ scale	δ	$\delta = 10^6 (\nu - \nu_0) / \nu_0$	1	
(indirect) spin-spin coupling constant	J_{AB}	$\hat{H} / h = J_{AB} \hat{I}_A \cdot \hat{I}_B$	Hz	
direct (dipolar) coupling constant	D_{AB}		Hz	
longitudinal relaxation time	T_1		s	
transverse relaxation time	T_2		s	
electron spin resonance, electron paramagnetic resonance (ESR, EPR), magnetogyric ratio	γ	$\gamma = \mu / s \hbar$	C kg^{-1}	
g factor	g	$h\nu = g \mu_B B$	1	
hyperfine coupling constant, in liquids	a, A	$\hat{H}_{\text{hfs}} / h = a \hat{S} \cdot \hat{I}$	Hz	
in solids	T	$\hat{H}_{\text{hfs}} / h = \hat{S} \cdot T \cdot \hat{I}$	Hz

mass of atom, atomic mass	m_a, m		kg
mass of entity (molecule, or formula unit)	m_r, m		kg
atomic mass constant	m_u	$m_u = m_a(^{12}C)/12$	kg
molar mass	M	$M_B = m/n_B$	$kg\ mol^{-1}$
relative molecular mass (relative molar mass, molecular weight)	M_r	$M_{r,B} = m_B/m_u$	1
molar volume	V_m	$V_{m,B} = V/n_B$	$m^3\ mol^{-1}$
mass fraction	w	$w_B = m_B/\Sigma m_i$	1
volume fraction	ϕ	$\phi_B = V_B/\Sigma V_i$	1
mole fraction, amount fraction, number fraction	x, y	$x_B = n_B/\Sigma n_i$	1
(total) pressure	p, P		Pa
partial pressure	p_B	$p_B = y_B p$	Pa
mass concentration (mass density)	γ, ρ	$\gamma_B = m_B/V$	$kg\ m^{-3}$
number concentration, number density of entities	C, n	$C_B = N_B/V$	m^{-3}
amount concentration, concentration	c	$c_B = n_B/V$	$mol\ m^{-3}$
solubility	s	$s_B = c_B$ (saturated solution)	$mol\ m^{-3}$
molality (of a solute)	$m, (b)$	$m_B = n_B/m_A$	$mol\ kg^{-1}$

SYMBOLS AND TERMINOLOGY FOR PHYSICAL AND CHEMICAL QUANTITIES (continued)

Name	Symbol	Definition	SI unit
surface concentration	Γ	$\Gamma_{\text{B}} = n_{\text{B}}/A$	mol m^{-2}
stoichiometric number	ν		1
extent of reaction, advancement	ξ	$\Delta\xi = \Delta n_{\text{B}}/\nu_{\text{B}}$	mol
degree of dissociation	α		1
CHEMICAL THERMODYNAMICS			
heat	q, Q		J
work	w, W		J
internal energy	U	$\Delta U = q + w$	J
enthalpy	H	$H = U + pV$	J
thermodynamic temperature	T		K
Celsius temperature	θ, t	$\theta/^{\circ}\text{C} = T/\text{K} - 273.15$	$^{\circ}\text{C}$
entropy	S	$dS \geq dq/T$	JK^{-1}
Helmholtz energy, (Helmholtz function)	A	$A = U - TS$	J
Gibbs energy, (Gibbs function)	G	$G = H - TS$	J
Massieu function	J	$J = -A/T$	JK^{-1}
Planck function	Y	$Y = -G/T$	JK^{-1}
surface tension	γ, σ	$\gamma = (\partial G/\partial A_s)_{T, p}$	$\text{J m}^{-2}, \text{N m}^{-1}$
molar quantity X	X_{m}	$X_{\text{m}} = X/n$	(varies)
specific quantity X	x	$x = X/m$	(varies)
pressure coefficient	β	$\beta = (\partial p/\partial T)_{\text{V}}$	Pa K^{-1}
relative pressure coefficient	α_p	$\alpha_p = (1/p)(\partial p/\partial T)_{\text{V}}$	K^{-1}
compressibility, isothermal	κ_T	$\kappa_T = -(1/V)(\partial V/\partial p)_T$	Pa^{-1}
isentropic	κ_S	$\kappa_S = -(1/V)(\partial V/\partial p)_S$	Pa^{-1}
linear expansion coefficient	α_l	$\alpha_l = (1/l)(\partial l/\partial T)$	K^{-1}
cubic expansion coefficient	$\alpha, \alpha_{\text{V}}, \gamma$	$\alpha = (1/V)(\partial V/\partial T)_p$	K^{-1}
heat capacity, at constant pressure	C_p	$C_p = (\partial H/\partial T)_p$	JK^{-1}
at constant volume	C_{V}	$C_{\text{V}} = (\partial U/\partial T)_{\text{V}}$	JK^{-1}
ratio of heat capacities	$\gamma, (\kappa)$	$\gamma = C_p/C_{\text{V}}$	1
Joule–Thomson coefficient	μ, μ_{JT}	$\mu = (\partial T/\partial p)_H$	K Pa^{-1}
second virial coefficient	B	$pV_{\text{m}} = RT(1 + B/V_{\text{m}} + \dots)$	$\text{m}^3 \text{mol}^{-1}$
compression factor (compressibility factor)	Z	$Z = pV_{\text{m}}/RT$	1

SYMBOLS AND TERMINOLOGY FOR PHYSICAL AND CHEMICAL QUANTITIES (continued)

Name	Symbol	Definition	SI unit
partial molar quantity X	$X_B, (X'_B)$	$X_B = (\partial X / \partial n_B)_{T, p, n_{j \neq B}}$	(varies)
chemical potential (partial molar Gibbs energy)	μ	$\mu_B = (\partial G / \partial n_B)_{T, p, n_{j \neq B}}$	J mol^{-1}
absolute activity	λ	$\lambda_B = \exp(\mu_B / RT)$	1
standard chemical potential	μ°, μ^\ominus		J mol^{-1}
standard partial molar enthalpy	H_B°	$H_B^\circ = \mu_B^\circ + TS_B^\circ$	J mol^{-1}
standard partial molar entropy	S_B°	$S_B^\circ = -(\partial \mu_B^\circ / \partial T)_p$	$\text{J mol}^{-1} \text{K}^{-1}$
standard reaction Gibbs energy (function)	$\Delta_r G^\circ$	$\Delta_r G^\circ = \sum_B \nu_B \mu_B^\circ$	J mol^{-1}
affinity of reaction	$A, (\mathcal{A})$	$A = -(\partial G / \partial \xi)_{p, T}$ $= -\sum_B \nu_B \mu_B$	J mol^{-1}
standard reaction enthalpy	$\Delta_r H^\circ$	$\Delta_r H^\circ = \sum_B \nu_B H_B^\circ$	J mol^{-1}
standard reaction entropy	$\Delta_r S^\circ$	$\Delta_r S^\circ = \sum_B \nu_B S_B^\circ$	$\text{J mol}^{-1} \text{K}^{-1}$
equilibrium constant	K°, K	$K^\circ = \exp(-\Delta_r G^\circ / RT)$	1
equilibrium constant, pressure basis	K_p	$K_p = \prod_B p_B^{\nu_B}$	$\text{Pa}^{\sum \nu}$
concentration basis	K_c	$K_c = \prod_B c_B^{\nu_B}$	$(\text{mol m}^{-3})^{\sum \nu}$
molality basis	K_m	$K_m = \prod_B m_B^{\nu_B}$	$(\text{mol kg}^{-1})^{\sum \nu}$
fugacity	f, \tilde{p}	$f_B = \lambda_B \lim_{p \rightarrow 0} (p_B / \lambda_B)_T$	Pa
fugacity coefficient	ϕ	$\phi_B = f_B / p_B$	1
activity and activity coefficient referenced to Raoult's law, (relative) activity	a	$a_B = \exp\left[\frac{\mu_B - \mu_B^*}{RT}\right]$	1
activity coefficient	f	$f_B = a_B / x_B$	1
activities and activity coefficients referenced to Henry's law, (relative) activity, molality basis	a_m	$a_{m, B} = \exp\left[\frac{\mu_B - \mu_B^\circ}{RT}\right]$	1
concentration basis	a_c	$a_{c, B} = \exp\left[\frac{\mu_B - \mu_B^\circ}{RT}\right]$	1

SYMBOLS AND TERMINOLOGY FOR PHYSICAL AND CHEMICAL QUANTITIES (continued)

mole fraction basis	a_x	$a_{x, B} = \exp \left[\frac{\mu_B - \mu_B^\circ}{RT} \right]$	1
activity coefficient, molality basis	γ_m	$a_{m, B} = \gamma_{m, B} m_B / m^\circ$	1
concentration basis	γ_c	$a_{c, B} = \gamma_{c, B} c_B / c^\circ$	1
mole fraction basis	γ_x	$a_{x, B} = \gamma_{x, B} x_B$	1
ionic strength, molality basis	I_m, I	$I_m = \frac{1}{2} \sum m_B z_B^2$	mol kg ⁻¹
concentration basis	I_c, I	$I_c = \frac{1}{2} \sum c_B z_B^2$	mol m ⁻³
osmotic coefficient, molality basis	ϕ_m	$\phi_m = (\mu_A^* - \mu_A) / (RT M_A \sum m_B)$	1
mole fraction basis	ϕ_x	$\phi_x = (\mu_A - \mu_A^*) / (RT \ln x_A)$	1
osmotic pressure	Π	$\Pi = c_B RT$ (ideal dilute solution)	Pa

(i) *Symbols used as subscripts to denote a chemical process or reaction*

These symbols should be printed in roman (upright) type, without a full stop (period).

vaporization, evaporation (liquid→gas)	vap
sublimation (solid→gas)	sub
melting, fusion (solid→liquid)	fus
transition (between two phases)	trs
mixing of fluids	mix
solution (of solute in solvent)	sol
dilution (of a solution)	dil
adsorption	ads
displacement	dpl
immersion	imm
reaction in general	r
atomization	at
combustion reaction	c
formation reaction	f

(ii) *Recommended superscripts*

standard	⊖, o
pure substance	*
infinite dilution	∞
ideal	id
activated complex, transition state	‡
excess quantity	E

CHEMICAL KINETICS			
rate of change of quantity X	\dot{X}	$\dot{X} = dX/dt$	(varies)
rate of conversion	$\dot{\xi}$	$\dot{\xi} = d\xi/dt$	mol s^{-1}
rate of concentration change (due to chemical reaction)	r_B, v_B	$r_B = dc_B/dt$	$\text{mol m}^{-3} \text{s}^{-1}$
rate of reaction (based on amount concentration)	v	$v = \dot{\xi}/V$ $= v_B^{-1} dc_B/dt$	$\text{mol m}^{-3} \text{s}^{-1}$
partial order of reaction	n_B	$v = k \Pi c_B^{n_B}$	1
overall order of reaction	n	$n = \sum n_B$	1
rate constant, rate coefficient	k	$v = k \Pi c_B^{n_B}$	$(\text{mol}^{-1} \text{m}^3)^{n-1} \text{s}^{-1}$
Boltzmann constant	k, k_B		J K^{-1}
half life	$t_{1/2}$	$c(t_{1/2}) = c_0/2$	s
relaxation time	τ	$\tau = 1/(k_1 + k_{-1})$	s
energy of activation, activation energy	E_a, E	$E_a = RT^2 d \ln k/dT$	J mol^{-1}
pre-exponential factor	A	$k = A \exp(-E_a/RT)$	$(\text{mol}^{-1} \text{m}^3)^{n-1} \text{s}^{-1}$
volume of activation	$\Delta^\ddagger V$	$\Delta^\ddagger V = -RT \times (\partial \ln k / \partial p)_T$	$\text{m}^3 \text{mol}^{-1}$
collision diameter	d	$d_{AB} = r_A + r_B$	m
collision cross-section	σ	$\sigma_{AB} = \pi d_{AB}^2$	m^2
collision frequency	Z_A		s^{-1}
collision number	Z_{AB}, Z_{AA}		$\text{m}^{-3} \text{s}^{-1}$
collision frequency factor	z_{AB}, z_{AA}	$z_{AB} = Z_{AB}/Lc_Ac_B$	$\text{m}^3 \text{mol}^{-1} \text{s}^{-1}$
standard enthalpy of activation	$\Delta^\ddagger H^\circ, \Delta H^\ddagger$		J mol^{-1}
standard entropy of activation	$\Delta^\ddagger S^\circ, \Delta S^\ddagger$		$\text{J mol}^{-1} \text{K}^{-1}$
standard Gibbs energy of activation	$\Delta^\ddagger G^\circ, \Delta G^\ddagger$		J mol^{-1}
quantum yield, photochemical yield	ϕ		1
ELECTROCHEMISTRY			
elementary charge (proton charge)	e		C
Faraday constant	F	$F = eL$	C mol^{-1}

SYMBOLS AND TERMINOLOGY FOR PHYSICAL AND CHEMICAL QUANTITIES (continued)

<i>Name</i>	<i>Symbol</i>	<i>Definition</i>	<i>SI unit</i>
charge number of an ion	z	$z_B = Q_B/e$	1
ionic strength	I_c, I	$I_c = \frac{1}{2} \sum c_i z_i^2$	mol m^{-3}
mean ionic activity	a_{\pm}	$a_{\pm} = m_{\pm} \gamma_{\pm} / m^{\circ}$	1
mean ionic molality	m_{\pm}	$m_{\pm}^{(v_+ + v_-)} = m_+^{v_+} m_-^{v_-}$	mol kg^{-1}
mean ionic activity coefficient	γ_{\pm}	$\gamma_{\pm}^{(v_+ + v_-)} = \gamma_+^{v_+} \gamma_-^{v_-}$	1
charge number of electrochemical cell reaction	$n, (z)$		1
electric potential difference (of a galvanic cell)	$\Delta V, E, U$	$\Delta V = V_R - V_L$	V
emf, electromotive force	E	$E = \lim_{I \rightarrow 0} \Delta V$	V
standard emf, standard potential of the electrochemical cell reaction	E°	$E^{\circ} = -\Delta_r G^{\circ} / nF$ $= (RT/nF) \ln K^{\circ}$	V
standard electrode potential	E°		V
emf of the cell, potential of the electro- chemical cell reaction	E	$E = E^{\circ} - (RT/nF) \times \sum v_i \ln a_i$	V
pH	pH	$\text{pH} \approx -\lg \left[\frac{c(\text{H}^+)}{\text{mol dm}^{-3}} \right]$	1
inner electric potential	ϕ	$\nabla \phi = -E$	V
outer electric potential	ψ	$\psi = Q/4\pi\epsilon_0 r$	V
surface electric potential	χ	$\chi = \phi - \psi$	V
Galvani potential difference	$\Delta\phi$	$\Delta_{\alpha}^{\beta} \phi = \phi^{\beta} - \phi^{\alpha}$	V
volta potential difference	$\Delta\psi$	$\Delta_{\alpha}^{\beta} \psi = \psi^{\beta} - \psi^{\alpha}$	V
electrochemical potential	$\tilde{\mu}$	$\tilde{\mu}_B^{\alpha} = (\partial G / \partial n_B^{\alpha})$	J mol^{-1}
electric current	I	$I = dQ/dt$	A
(electric) current density	j	$j = I/A$	A m^{-2}
(surface) charge density	σ	$\sigma = Q/A$	C m^{-2}
electrode reaction rate constant	k	$k_{\text{ox}} = I_a / (nFA \prod_i c_i^{n_i})$	(varies)
mass transfer coefficient, diffusion rate constant	k_d	$k_{d,B} = v_B I_{1,B} / nFcA$	m s^{-1}
thickness of diffusion layer	δ	$\delta_B = D_B / k_{d,B}$	m

SYMBOLS AND TERMINOLOGY FOR PHYSICAL AND CHEMICAL QUANTITIES (continued)

<i>Name</i>	<i>Symbol</i>	<i>Definition</i>	<i>SI unit</i>
transfer coefficient (electrochemical)	α	$\alpha_c = \frac{- v RT}{nF} \frac{\partial \ln I_c }{\partial E}$	1
overpotential	η	$\eta = E_I - E_{I=0} - IR_u$	V
electrokinetic potential (zeta potential)	ζ		V
conductivity	$\kappa, (\sigma)$	$\kappa = j/E$	$S m^{-1}$
conductivity cell constant	K_{cell}	$K_{cell} = \kappa R$	m^{-1}
molar conductivity (of an electrolyte)	Λ	$\Lambda_B = \kappa/c_B$	$S m^2 mol^{-1}$
ionic conductivity, molar conductivity of an ion	λ	$\lambda_B = z_B F u_B$	$S m^2 mol^{-1}$
electric mobility	$u, (\mu)$	$u_B = v_B/E$	$m^2 V^{-1} s^{-1}$
transport number	t	$t_B = j_B/\Sigma j_i$	1
reciprocal radius of ionic atmosphere	κ	$\kappa = (2F^2 I/\epsilon RT)^{1/2}$	m^{-1}
COLLOID AND SURFACE CHEMISTRY			
specific surface area	a, a_s, s	$a = A/m$	$m^2 kg^{-1}$
surface amount of B, adsorbed amount of B	n_B^s, n_B^a		mol
surface excess of B	n_B^σ		mol
surface excess concentration of B	$\Gamma_B, (\Gamma_B^\sigma)$	$\Gamma_B = n_B^\sigma/A$	$mol m^{-2}$
total surface excess concentration	$\Gamma, (\Gamma^\sigma)$	$\Gamma = \Sigma_i \Gamma_i$	$mol m^{-2}$
area per molecule	a, σ	$a_B = A/N_B^\sigma$	m^2
area per molecule in a filled monolayer	a_m, σ_m	$a_{m,B} = A/N_{m,B}$	m^2
surface coverage	θ	$\theta = N_B^\sigma/N_{m,B}$	1
contact angle	θ		1, rad
film thickness	t, h, δ		m
thickness of (surface or interfacial) layer	τ, δ, t		m
surface tension, interfacial tension	γ, σ	$\gamma = (\partial G/\partial A_s)_{T,p}$	$N m^{-1}, J m^{-2}$
film tension	Σ_f	$\Sigma_f = 2\gamma_f$	$N m^{-1}$
reciprocal thickness of the double layer	κ	$\kappa = [2F^2 I_c/\epsilon RT]^{1/2}$	m^{-1}
average molar masses			
number-average	M_n	$M_n = \Sigma n_i M_i/\Sigma n_i$	$kg mol^{-1}$
mass-average	M_m	$M_m = \Sigma n_i M_i^2/\Sigma n_i M_i$	$kg mol^{-1}$

SYMBOLS AND TERMINOLOGY FOR PHYSICAL AND CHEMICAL QUANTITIES (continued)

<i>Name</i>	<i>Symbol</i>	<i>Definition</i>	<i>SI unit</i>
Z-average	M_z	$M_z = \sum n_i M_i^3 / \sum n_i M_i^2$	kg mol^{-1}
sedimentation coefficient	s	$s = v/a$	s
van der Waals constant	λ		J
retarded van der Waals constant	β, B		J
van der Waals–Hamaker constant	A_H		J
surface pressure	π^s, π	$\pi^s = \gamma^0 - \gamma$	N m^{-1}

TRANSPORT PROPERTIES

flux (of a quantity X)	J_X, J	$J_X = A^{-1} dX/dt$	(varies)
volume flow rate	q_v, \dot{V}	$q_v = dV/dt$	$\text{m}^3 \text{s}^{-1}$
mass flow rate	q_m, \dot{m}	$q_m = dm/dt$	kg s^{-1}
mass transfer coefficient	k_d		m s^{-1}
heat flow rate	ϕ	$\phi = dq/dt$	W
heat flux	J_q	$J_q = \phi/A$	W m^{-2}
thermal conductance	G	$G = \phi/\Delta T$	W K^{-1}
thermal resistance	R	$R = 1/G$	K W^{-1}
thermal conductivity	λ, k	$\lambda = J_q/(dT/dl)$	$\text{W m}^{-1} \text{K}^{-1}$
coefficient of heat transfer	$h, (k, K, \alpha)$	$h = J_q/\Delta T$	$\text{W m}^{-2} \text{K}^{-1}$
thermal diffusivity	a	$a = \lambda/\rho c_p$	$\text{m}^2 \text{s}^{-1}$
diffusion coefficient	D	$D = J_n/(dc/dl)$	$\text{m}^2 \text{s}^{-1}$

The following symbols are used in the definitions of the dimensionless quantities: mass (m), time (t), volume (V), area (A), density (ρ), speed (v), length (l), viscosity (η), pressure (p), acceleration of free fall (g), cubic expansion coefficient (α), temperature (T), surface tension (γ), speed of sound (c), mean free path (λ), frequency (f), thermal diffusivity (a), coefficient of heat transfer (h), thermal conductivity (k), specific heat capacity at constant pressure (c_p), diffusion coefficient (D), mole fraction (x), mass transfer coefficient (k_d), permeability (μ), electric conductivity (κ), and magnetic flux density (B).

<i>Name</i>	<i>Symbol</i>	<i>Definition</i>	<i>SI unit</i>
Reynolds number	Re	$Re = \rho v l / \eta$	1
Euler number	Eu	$Eu = \Delta p / \rho v^2$	1
Froude number	Fr	$Fr = v / (lg)^{1/2}$	1
Grashof number	Gr	$Gr = l^3 g \alpha \Delta T \rho^2 / \eta^2$	1
Weber number	We	$We = \rho v^2 l / \gamma$	1
Mach number	Ma	$Ma = v / c$	1
Knudsen number	Kn	$Kn = \lambda / l$	1
Strouhal number	Sr	$Sr = lf / v$	1
Fourier number	Fo	$Fo = at / l^2$	1
Péclet number	Pe	$Pe = vl / a$	1
Rayleigh number	Ra	$Ra = l^3 g \alpha \Delta T \rho / \eta a$	1
Nusselt number	Nu	$Nu = hl / k$	1
Stanton number	St	$St = h / \rho v c_p$	1

Nusselt number for mass transfer	Nu^*	$Nu^* = k_d l/D$	1
Stanton number for mass transfer	St^*	$St^* = k_d/v$	1
Prandtl number	Pr	$Pr = \eta/\rho a$	1
Schmidt number	Sc	$Sc = \eta/\rho D$	1
Lewis number	Le	$Le = a/D$	1
magnetic Reynolds number	Rm, Re_m	$Rm = v\mu kl$	1
Alfvén number	Al	$Al = v(\rho\mu)^{1/2}/B$	1
Hartmann number	Ha	$Ha = Bl(\kappa/\eta)^{1/2}$	1
Cowling number	Co	$Co = B^2/\mu\rho v^2$	1

NOMENCLATURE OF CHEMICAL COMPOUNDS

The International Union of Pure and Applied Chemistry (IUPAC) maintains several commissions that deal with the naming of chemical substances. In general, the approach of IUPAC is to present rules for arriving at names in a systematic manner, rather than recommending a unique name for each compound. Thus there are often several alternative "IUPAC names", depending on which nomenclature system is used, each of which may have advantages in specific applications. However, each of these names will be unambiguous.

Organizations such as the Chemical Abstracts Service and the Beilstein Institute that prepare indexes to the chemical literature must adopt a system for selecting unique names in order to avoid excessive cross referencing. Chemical Abstracts Service uses a system which groups together compounds derived from a single parent compound. Thus most index names are inverted (e.g., Benzene, bromo rather than bromobenzene; Acetic acid, sodium salt rather than sodium acetate). In this *Handbook* the CAS Index Names are used only in the table "Physical Constants of Organic Compounds". Other tables use more familiar names which, with a few possible exceptions, conform to one of the IUPAC naming systems.

Recommended names for the most common substituent groups, ligands, ions, and organic rings are given in the two following tables, "Nomenclature for Inorganic Ions and Ligands" and "Organic Substituent Groups and Ring Systems". For the basics of macromolecular nomenclature, see "Naming Organic Polymers" in Section 13.

Some of the most useful recent guides to chemical nomenclature, prepared by IUPAC and other organizations such as the International Union of Biochemistry and Molecular Biology (IUBMB) and the American Chemical Society are listed below. These books contain citations to the more detailed nomenclature documents in each area.

NOMENCLATURE FOR INORGANIC IONS AND LIGANDS

See the table *Nomenclature of Chemical Compounds* for references. The assistance of Warren H. Powell in preparing this list is gratefully acknowledged.

Group	As cation	As anion	As ligand	As prefix in organic compounds
H	hydrogen	hydride	hydrido	
F	fluorine	fluoride	fluoro	fluoro
Cl	chlorine	chloride	chloro	chloro
Br	bromine	bromide	bromo	bromo
I	iodine	iodide	iodo	iodo
ClO	chlorosyl	hypochlorite	hypochlorito	chlorosyl
ClO ₂	chloryl	chlorite	chlorito	chloryl
ClO ₃	perchloryl	chlorate	chlorato	perchloryl
ClO ₄		perchlorate		
IO	iodosyl	hypoiodite		iodoso
IO ₂	iodyl			iodyl; iodoxy
O		oxide	oxo	oxo
O ₂		peroxide (O ₂ ²⁻) hyperoxide (O ₂ ⁻)	peroxo	peroxy
HO		hydroxide	hydroxo	hydroxy
HO ₂		hydrogen peroxide	hydrogen peroxo	hydroperoxy
S		sulfide	thio; sulfido	thio; thioxo
HS		hydrogen sulfide	thiolo	mercapto
S ₂		disulfide	disulfido	
SO	sulfinyl; thionyl			sulfinyl
SO ₂	sulfonyl; sulfuryl	sulfoxylate		sulfonyl
SO ₃		sulfite	sulfito	
HSO ₃		hydrogen sulfite	hydrogen sulfito	
S ₂ O ₃		thiosulfate	thiosulfato	
SO ₄		sulfate	sulfato	
Se		selenide	seleno	seleno; selenoxo
SeO	seleninyl			seleninyl
SeO ₂	selenonyl			selenonyl
SeO ₃		selenite	selenito	
SeO ₄		selenate	selenato	
Te		telluride	telluro	telluro; telluroxo
CrO ₂	chromyl			
UO ₂	uranyl			
NpO ₂	neptunyl			
PuO ₂	plutonyl			
AmO ₂	americyl			
N		nitride	nitrido	
N ₃		azide	azido	
NH		imide	imido	imino
NH ₂		amide	amido	amino
NHOH		hydroxylamide	hydroxylamido	hydroxyamino
N ₂ H ₃		hydrazide	hydrazido	hydrazino; diazanyl
NO	nitrosyl		nitrosyl	nitroso
NO ₂	nitryl		nitro	nitro
ONO		nitrite	nitrito	
NS	thionitrosyl			
NO ₃		nitrate	nitrato	
N ₂ O ₃		hyponitrite	hyponitrito	
P		phosphide	phosphido	phosphinidyne phosphoroso; phosphinylidyne
PO	phosphoryl			
PO ₂	phospho			
PS	thiophosphoryl			phosphinothioylidyne; thiophosphorozo
PH ₂ O ₃		hypophosphite	hypophosphito	
PHO ₃		phosphite	phosphito	

NOMENCLATURE FOR INORGANIC IONS AND LIGANDS (continued)

Group	As cation	As anion	As ligand	As prefix in organic compounds
PO ₄		phosphate	phosphato	
AsO ₄		arsenate	arsenato	
VO	vanadyl			
CO	carbonyl		carbonyl	carbonyl
CS	thiocarbonyl			thiocarbonyl
CH ₃ O		methanolate	methoxo	methoxy
C ₂ H ₅ O		ethanolate	ethoxo	ethoxy
CH ₃ S		methanethiolate	methanethiolato	methylthio
C ₂ H ₅ S		ethanethiolate	ethanethiolato	ethylthio
CN	cyanogen	cyanide	cyano	cyano
OCN		cyanate	cyanato	cyanato
SCN		thiocyanate	thiocyanato	thiocyanato
SeCN		selenocyanate	selenocyanato	selenocyanato
TeCN		tellurocyanate	tellurocyanato	tellurocyanato
CO ₃		carbonate	carbonato	
HCO ₃		hydrogen carbonate	hydrogen carbonato	carboxycarbonyl
C ₂ O ₄		oxalate	oxalato	

ORGANIC SUBSTITUENT GROUPS AND RING SYSTEMS

The first part of this table lists substituent groups and their line formulas. A substituent group is defined by IUPAC as a group that replaces one or more hydrogen atoms attached to a parent structure. Such groups are sometimes called radicals, but IUPAC now reserves the term radical for a free molecular species with unpaired electrons. IUPAC does not recommend some of these names, which are marked here with asterisks (e.g., amyl*), but they are included in this list because they are often encountered in the older literature. Substituent group names which are formed by systematic rules (e.g., methyl from methane, ethyl from ethane, etc.) are included here only for the first few members of a homologous series.

In the second part of the table a number of common organic ring compounds are shown, with the conventional numbering of the ring positions indicated.

The help of Warren H. Powell in preparing this table is greatly appreciated. Pertinent references may be found in the table *Nomenclature of Chemical Compounds*.

SUBSTITUENT GROUPS

acetamido (acetylamino)	$\text{CH}_3\text{CONH-}$	cyanamido (cyanoamino)	NCNH-
acetoacetyl	$\text{CH}_3\text{COCH}_2\text{CO-}$	cyanato	NCO-
acetonyl	$\text{CH}_3\text{COCH}_2\text{-}$	cyano	NC-
acetyl	$\text{CH}_3\text{CO-}$	decanedioyl	$-\text{OC}(\text{CH}_2)_8\text{CO-}$
acryloyl* (1-oxo-2-propenyl)	$\text{CH}_2=\text{CHCO-}$	decanoyl	$\text{CH}_3(\text{CH}_2)_8\text{CO-}$
alanyl (from alanine)	$\text{CH}_3\text{CH}(\text{NH}_2)\text{CO-}$	diazo	$\text{N}_2=$
β -alanyl	$\text{H}_2\text{N}(\text{CH}_2)_2\text{CO-}$	diazoamino	$-\text{NHN}=\text{N-}$
allyl (2-propenyl)	$\text{CH}_2=\text{CHCH}_2\text{-}$	disilanyl	$\text{H}_2\text{SiSiH}_2\text{-}$
allylidene (2-propenyldiene)	$\text{CH}_2=\text{CHCH=}$	disiloxanyloxy	$\text{H}_3\text{SiOSiH}_2\text{O-}$
amidino (aminoiminomethyl)	$\text{H}_2\text{NC}(\text{=NH})\text{-}$	disulfinyl	$-\text{S}(\text{O})\text{S}(\text{O})\text{-}$
amino	$\text{H}_2\text{N-}$	dithio	$-\text{SS-}$
amyl* (pentyl)	$\text{CH}_3(\text{CH}_2)_4\text{-}$	enanthoyl* (heptanoyl)	$\text{CH}_3(\text{CH}_2)_5\text{CO-}$
anilino (phenylamino)	$\text{C}_6\text{H}_5\text{NH-}$	epoxy	$-\text{O-}$
anisidino	$\text{CH}_3\text{OC}_6\text{H}_4\text{NH-}$	ethenyl (vinyl)	$\text{CH}_2=\text{CH-}$
anthranoyl (2-aminobenzoyl)	$2\text{-H}_2\text{NC}_6\text{H}_4\text{CO-}$	ethynyl	$\text{HC}\equiv\text{C-}$
arsino	$\text{AsH}_2\text{-}$	ethoxy	$\text{C}_2\text{H}_5\text{O-}$
azelaoyl (from azelaic acid)	$-\text{OC}(\text{CH}_2)_7\text{CO-}$	ethyl	$\text{CH}_3\text{CH}_2\text{-}$
azido	$\text{N}_3\text{-}$	ethylene	$-\text{CH}_2\text{CH}_2\text{-}$
azino	$=\text{N-N=}$	ethylidene	$\text{CH}_2\text{CH=}$
azo	$-\text{N}=\text{N-}$	ethylthio	$\text{C}_2\text{H}_5\text{S-}$
azoxy	$-\text{N}(\text{O})=\text{N-}$	formamido (formylamino)	HCONH-
benzal* (benzylidene)	$\text{C}_6\text{H}_5\text{CH=}$	formyl	HCO-
benzamido (benzoylamino)	$\text{C}_6\text{H}_5\text{CONH-}$	fumaroyl (from fumaric acid)	$-\text{OCC}=\text{CHCO-}$
benzhydrl (diphenylmethyl)	$(\text{C}_6\text{H}_5)_2\text{CH-}$	furfuryl (2-furanylmethyl)	$\text{OC}_4\text{H}_7\text{CH}_2\text{-}$
benzoxy* (benzoyloxy)	$\text{C}_6\text{H}_5\text{COO-}$	furfurylidene (2-furanylmethylene)	$\text{OC}_4\text{H}_7\text{CH=}$
benzoyl	$\text{C}_6\text{H}_5\text{CO-}$	glutamoyl (from glutamic acid)	$-\text{OC}(\text{CH}_2)_2\text{CH}(\text{NH}_2)\text{CO-}$
benzyl	$\text{C}_6\text{H}_5\text{CH}_2\text{-}$	glutaryl (from glutaric acid)	$-\text{OC}(\text{CH}_2)_3\text{CO-}$
benzylidene	$\text{C}_6\text{H}_5\text{CH=}$	glycylamino	$\text{H}_2\text{NCH}_2\text{CONH-}$
benzylidene	$\text{C}_6\text{H}_5\text{C=}$	glycoloyl; glycolyl (hydroxyacetyl)	$\text{HOCH}_2\text{CO-}$
biphenyl	$\text{C}_6\text{H}_5\text{C}_6\text{H}_5\text{-}$	glycyl (aminoacetyl)	$\text{H}_2\text{NCH}_2\text{CO-}$
biphenylene	$-\text{C}_6\text{H}_4\text{-C}_6\text{H}_4\text{-}$	glyoxyloyl; glyoxylyl (oxoacetyl)	HCOCO-
butoxy	$\text{C}_4\text{H}_9\text{O-}$	guanidino	$\text{H}_2\text{NC}(\text{=NH})\text{NH-}$
sec-butoxy (1-methylpropoxy)	$\text{C}_2\text{H}_5\text{CH}(\text{CH}_3)\text{O-}$	guanyl (aminoiminomethyl)	$\text{H}_2\text{NC}(\text{=NH})\text{-}$
tert-butoxy (1,1-dimethylethoxy)	$(\text{CH}_3)_3\text{CO-}$	heptadecanoyl	$\text{CH}_3(\text{CH}_2)_{15}\text{CO-}$
butyl	$\text{CH}_3(\text{CH}_2)_3\text{-}$	heptanamido	$\text{CH}_3(\text{CH}_2)_5\text{CONH-}$
sec-butyl (1-methylpropyl)	$\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)\text{-}$	heptanedioyl	$-\text{OC}(\text{CH}_2)_5\text{CO-}$
tert-butyl (1,1-dimethylethyl)	$(\text{CH}_3)_3\text{C-}$	heptanoyl	$\text{CH}_3(\text{CH}_2)_5\text{CO-}$
butyryl (1-oxobutyl)	$\text{CH}_3(\text{CH}_2)_2\text{CO-}$	hexadecanoyl	$\text{CH}_3(\text{CH}_2)_{14}\text{CO-}$
caproyl* (hexanoyl)	$\text{CH}_3(\text{CH}_2)_4\text{CO-}$	hexamethylene (1,6-hexanediy)	$-(\text{CH}_2)_6\text{-}$
capryl* (decanoyl)	$\text{CH}_3(\text{CH}_2)_6\text{CO-}$	hexanedioyl	$-\text{OC}(\text{CH}_2)_4\text{CO-}$
capryloyl* (octanoyl)	$\text{CH}_3(\text{CH}_2)_6\text{CO-}$	hippuryl (N-benzoylglycyl)	$\text{C}_6\text{H}_5\text{CONHCH}_2\text{CO-}$
carbamido (carbamoylamino)	$\text{H}_2\text{NCONH-}$	hydrazino	$\text{H}_2\text{NNH-}$
carbamoyl (aminocarbonyl)	$\text{H}_2\text{NCO-}$	hydrazo	$-\text{HNNH-}$
carbamyl (aminocarbonyl)	$\text{H}_2\text{NCO-}$	hydrocinnamoyl	$\text{C}_6\text{H}_5(\text{CH}_2)_2\text{CO-}$
carbazoyle (hydrazinocarbonyl)	$\text{H}_2\text{NNHCO-}$	hydroperoxy	HOO-
carbathoxy (ethoxycarbonyl)	$\text{C}_2\text{H}_5\text{OCO-}$	hydroxyamino	HONH-
carbonyl	$=\text{C}=\text{O}$	hydroxy	HO-
carboxy	HOOC-	imino	HN=
cetyl* (hexadecyl)	$\text{CH}_3(\text{CH}_2)_{15}\text{-}$	iodoso* (iodosyl)	OI-
chloroformyl (chlorcarbonyl)	ClCO-	iodyl	$\text{O}_2\text{I-}$
cinnamoyl	$\text{C}_6\text{H}_5\text{CH}=\text{CHCO-}$	isoamyl* (isopentyl; 3-methylbutyl)	$(\text{CH}_3)_2\text{CH}(\text{CH}_2)_2\text{-}$
cinnamyl (3-phenyl-2-propenyl)	$\text{C}_6\text{H}_5\text{CH}=\text{CHCH}_2\text{-}$	isobutenyl (2-methyl-1-propenyl)	$(\text{CH}_3)_2\text{C}=\text{CH-}$
cinnamylidene	$\text{C}_6\text{H}_5\text{CH}=\text{CHCH=}$	isobutoxy (2-methylpropoxy)	$(\text{CH}_3)_2\text{CHCH}_2\text{O-}$
cresyl* (hydroxymethylphenyl)	$\text{HO}(\text{CH}_2)\text{C}_6\text{H}_4\text{-}$	isobutyl (2-methylpropyl)	$(\text{CH}_3)_2\text{CHCH}_2\text{-}$
crotonoyl	$\text{CH}_3\text{CH}=\text{CHCO-}$	isobutylidene (3-methylpropylidene)	$(\text{CH}_3)_2\text{CHCH=}$
crotyl (2-butenyl)	$\text{CH}_3\text{CH}=\text{CHCH}_2\text{-}$	isobutyryl (2-methyl-1-oxopropyl)	$(\text{CH}_3)_2\text{CHCO-}$

ORGANIC SUBSTITUENT GROUPS AND RING SYSTEMS (continued)

isocyanato	OCN-	picryl (2,4,6-trinitrophenyl)	2,4,6-(NO ₂) ₃ C ₆ H ₂ -
isocyano	CN-	pimeloyl (from pimelic acid)	-OC(CH ₂) ₅ CO-
isohexyl (4-methylpentyl)	(CH ₃) ₂ CH(CH ₂) ₃ -	piperidino (1-piperidinyl)	C ₅ H ₁₀ N-
isoleucyl (from isoleucine)	C ₂ H ₅ CH(CH ₃)CH(NH ₂)CO-	pivaloyl (from pivalic acid)	(CH ₃) ₃ CCO-
isonitroso* (hydroxyamino)	HON=	prenyl (3-methyl-2-butenyl)	(CH ₃) ₂ C=CHCH ₂ -
isopentyl (3-methylbutyl)	(CH ₃) ₂ CH(CH ₂) ₂ -	propargyl (2-propynyl)	HC≡CCH ₂ -

isopropyl (1-methylethyl)	(CH ₃) ₂ CH-	propoxy	CH ₃ CH ₂ CH ₂ O-
isopropylidene (1-methylethylidene)	(CH ₃) ₂ C=	propyl	CH ₃ CH ₂ CH ₂ -
isothiocyanato (isothiocyano)	SCN-	propylidene	CH ₃ CH ₂ CH=
isovaleryl* (3-methyl-1-oxobutyl)	(CH ₃) ₂ CHCH ₂ CO-	pyrryl (pyrrolyl)	C ₄ H ₄ N-
lactoyl (from lactic acid)	CH ₃ CH(OH)CO-	salicyloyl (2-hydroxybenzoyl)	2-HOC ₆ H ₄ CO-
lauroyl (from lauric acid)	CH ₃ (CH ₂) ₁₀ CO-	selenyl* (selanyl; hydroseleno)	HS-
lauryl (dodecyl)	CH ₃ (CH ₂) ₁₁ -	seryl (from serine)	HOCH ₂ CH(NH ₂)CO-
leucyl (from leucine)	(CH ₃) ₂ CHCH ₂ CH(NH ₂)CO-	siloxyl	H ₃ SiO-
levulinoyl (from levulinic acid)	CH ₃ CO(CH ₂) ₂ CO-	silyl	H ₃ Si-
malonyl (from malonic acid)	-OCC ₂ CO-	silylene	H ₂ Si=
mandeloyl (from mandelic acid)	C ₆ H ₅ CH(OH)CO-	sorboyl (from sorbic acid)	CH ₃ CH=CHCH=CHCO-
mercapto	HS-	stearoyl (from stearic acid)	CH ₃ (CH ₂) ₁₄ CO-
mesityl	2,4,6-(CH ₃) ₃ C ₆ H ₂ -	stearyl (octadecyl)	CH ₃ (CH ₂) ₁₇ -
methacryloyl (from methacrylic acid)	CH ₂ =C(CH ₃)CO-	styryl (2-phenylethenyl)	C ₆ H ₅ CH=CH-
methallyl (2-methyl-2-propenyl)	CH ₂ =C(CH ₃)CH ₂ -	suberoyl (from suberic acid)	-OC(CH ₂) ₆ CO-
methionyl (from methionine)	CH ₃ SCH ₂ CH ₂ CH(NH ₂)CO-	succinyl (from succinic acid)	-OCC ₂ CH ₂ CO-
methoxy	CH ₃ O-	sulfamino (sulfoamino)	HOSO ₂ NH-
methyl	H ₃ C-	sulfamoyl (sulfamyl)	H ₂ NSO ₂ -
methylene	H ₂ C=	sulfanilyl [(4-aminophenyl)sulfonyl]	4-H ₂ NC ₆ H ₄ SO ₂ -
methylthio	CH ₃ S-	sulfeno	HOS-
myristoyl (from myristic acid)	CH ₃ (CH ₂) ₁₂ CO-	sulfhydryl (mercapto)	HS-
myristyl (tetradecyl)	CH ₃ (CH ₂) ₁₃ -	sulfinyl	OS=
naphthyl	(C ₁₀ H ₇)-	sulfo	HO ₃ S-
naphthylene	-(C ₁₀ H ₆)-	sulfonyl (sulfuryl)	-SO ₂ -
neopentyl (2,2-dimethylpropyl)	(CH ₃) ₃ CCH ₂ -	terephthaloyl	1,4-C ₆ H ₄ (CO) ₂
nitramino (nitroamino)	O ₂ NNH-	tetramethylene	-(CH ₂) ₄ -
nitro	O ₂ N-	thienyl (from thiophene)	(C ₄ H ₃ S)-
nitrosamino (nitrosoamino)	ONNH-	thiocarbonyl (carbothionyl)	=CS
nitrosimino (nitrosoimino)	ONN=	thiocarboxy	HOSC-
nitroso	ON-	thiocyanato (thiocyano)	NCS-
nonanoyl (from nonanoic acid)	CH ₃ (CH ₂) ₇ CO-	thionyl* (sulfinyl)	-SO-
oleoyl (from oleic acid)	CH ₃ (CH ₂) ₇ CH=CH(CH ₂) ₇ CO-	threonyl (from threonine)	CH ₃ CH(OH)CH(NH ₂)CO-
oxalyl (from oxalic acid)	-OCCO-	toluidino [(methylphenyl)amino]	CH ₃ C ₆ H ₄ NH-
oxo	O=	toluoyl (methylbenzoyl)	CH ₃ C ₆ H ₄ CO-
palmitoyl (from palmitic acid)	CH ₃ (CH ₂) ₁₄ CO-	tolyl (methylphenyl)	CH ₃ C ₆ H ₄ -
pentamethylene (1,5-pentanediy)	-(CH ₂) ₅ -	α-tolyl (benzyl)	C ₆ H ₅ CH ₂ -
pentyl	CH ₃ (CH ₂) ₄ -	tolylene (methylphenylene)	-(CH ₃ C ₆ H ₃)-
tert-pentyl	CH ₃ CH ₂ C(CH ₃) ₂ -	tosyl [(4-methylphenyl) sulfonyl]	4-CH ₃ C ₆ H ₄ SO ₂ -
phenacyl	C ₆ H ₅ COCH ₂ -	triazeno	H ₂ NNHNH-
phenacylidene	C ₆ H ₅ COCH=	trimethylene (1,3-propanediy)	-(CH ₂) ₃ -
phenethyl (2-phenylethyl)	C ₆ H ₅ CH ₂ CH ₂ -	trityl (triphenylmethyl)	(C ₆ H ₅) ₃ C-
phenoxy	C ₆ H ₅ O-	valeryl* (pentanoyl)	CH ₃ (CH ₂) ₃ CO-
phenyl	C ₆ H ₅ -	valyl (from valine)	(CH ₃) ₂ CHCH(NH ₂)CO-
phenylene (benzenediyl)	-C ₆ H ₄ -	vinyl (ethenyl)	CH ₂ =CH-
phosphino* (phosphanyl)	H ₂ P-	vinylidene (ethenylidene)	CH ₂ =C=
phosphinyl* (phosphinoyl)	H ₂ P(O)-	xylidino [(dimethylphenyl)amino]	(CH ₃) ₂ C ₆ H ₃ NH-
phospho	O ₂ P-	xylyl (dimethylphenyl)	(CH ₃) ₂ C ₆ H ₃ -
phosphono	(HO) ₂ P(O)-	xylylene [phenylenebis(methylene)]	-CH ₂ C ₆ H ₄ CH ₂ -
phthaloyl (from phthalic acid)	1,2-C ₆ H ₄ (CO) ₂

R = Nearly always methyl
R' = Usually methyl
R'' = Various groups

SCIENTIFIC ABBREVIATIONS AND SYMBOLS

This table lists some symbols, abbreviations, and acronyms encountered in the physical sciences. Most entries in italic type are symbols for physical quantities; for more details on these, see the table "Symbols and Terminology for Physical and Chemical Quantities" in this section. Additional information on units may be found in the table "International System of Units" in Section 1. Many of the terms to which these abbreviations refer are included in the tables "Definitions of Scientific Terms" in Section 2 and "Techniques for Materials Characterization" in Section 12.

Publication practices vary with regard to the use of capital or lower case letters for many abbreviations. An effort has been made to follow the most common practices in this table, but much variation is found in the literature. Likewise, policies on the use of periods in an abbreviation vary considerably. Periods are generally omitted in this table unless they are necessary for clarity. Periods should never appear in SI units. The SI prefixes (m, k, M, etc.) are not listed here, since they should never be used alone, but selected combinations with SI units (e.g., mg, kV, MW) are included.

Abbreviations are listed in alphabetical order without regard to case. Entries beginning with Greek letters fall at the end of the table.

<i>a</i>	absorption coefficient, acceleration, activity	<i>as, asym</i>	asymmetrical (as chemical descriptor)
a_0	Bohr radius	ASCII	American National Standard Code for Information Interchange
A	ampere, adenine (in genetic code)	ASE	aromatic stabilization energy
Å	ångstrom	Asn	asparagine
<i>A</i>	absorbance, area, Helmholtz energy, mass number	Asp	aspartic acid
A_H	Hall coefficient	at	atomization
A_r	atomic weight (relative atomic mass)	atm	standard atmosphere
AAS	atomic absorption spectroscopy	ATP	adenosine 5'-triphosphate
Abe	abequose	ATR	attenuated total internal reflection
abs	absolute	at.wt.	atomic weight
ac	alternating current	AU	astronomical unit
Ac	acetyl	av	average
AcOH	acetic acid	avdp	avoirdupois
ACT	activated complex theory	b	barn
ACTH	adrenocorticotrophic hormone	<i>B</i>	magnetic flux density, second virial coefficient, susceptance
Ade	adenine	bar	bar (pressure unit)
ADP	adenosine diphosphate	bbl	barrel
ads	adsorption	bcc	body centered cubic
ae	eon (10^9 years)	BCS	Bardeen-Cooper-Schrieffer (theory)
AES	atomic emission spectroscopy, Auger electron spectroscopy	BDE	bond dissociation energy
AF	audio frequency	Bé	Baumé
AFM	atomic force microscopy	BET	Brunauer-Emmett-Teller (method)
AI	artificial intelligence	BeV	billion electronvolt
AIM	atoms in molecules	Bhn	Brinell hardness number
<i>A_l</i>	Alfen number	Bi	biot
Ala	alanine	BN	bond number
alc	alcohol	BNS	nuclear backscattering spectroscopy
aliph.	aliphatic	BO	bond order, Born-Oppenheimer (approximation)
alk.	alkaline	BOD	biochemical oxygen demand
All	allose	bp	boiling point
Alt	altrose	bpy	2,2'-bipyridine
am	amorphous solid	Bq	becquerel
Am	amyl	BRE	bond resonance energy
AM	amplitude modulation	BSSE	basis set superposition error
AMP	adenosine 5'-monophosphate	Btu	British thermal unit
amu	atomic mass unit (recommended symbol is u)	bu	bushel
anh, anhyd	anhydrous	Bu	butyl
antilog	antilogarithm	Bz	benzoyl
AO	atomic orbital	Bzl	benzyl
AOM	angular overlap model	c	combustion reaction
Api	apiose	<i>c</i>	amount concentration, specific heat, velocity
APS	appearance potential spectroscopy	c_0	speed of light in vacuum
APW	augmented plane wave	C	coulomb, cytosine (in genetic code)
aq	aqueous	°C	degree Celsius
Ar	aryl	<i>C</i>	capacitance, heat capacity, number concentration
Ara	arabinose	ca.	approximately
Ara-ol	arabinitol	cal	calorie
Arg	arginine		

SCIENTIFIC ABBREVIATIONS AND SYMBOLS (continued)

calc	calculated	cwt	hundredweight (112 pounds)
CARS	coherent anti-Stokes Raman spectroscopy	Cy	cyclohexyl
CAS RN	Chemical Abstracts Service Registry Number	cyl	cylinder
CAT	clear-air turbulence, computerized axial tomography	Cys	cysteine
CBS	complete basis set	d	day, deuteron
cc	cubic centimeter	<i>d</i>	distance, density, dextrorotatory
CCD	charge-coupled device	D	debye unit
cd	candela, condensed phase	<i>D</i>	diffusion coefficient, dissociation energy, electric displacement
c.d.	current density	Da	dalton
CD	circular dichroism	DA	donor-acceptor (complex)
CDP	cytidine 5'-diphosphate	dB	decibel
CEPA	couplet electron pair approximation	dc	direct current
cf.	compare	DE	delocalization energy
cfm	cubic feet per minute	dec	decomposes
cg	centimeter-gram-second system	deg	degree
CHF	coupled Hartree-Fock (method)	den	density
Ci	curie	det	determinant
CI	configuration interaction, chemical ionization	dev	deviation
CIDEP	chemically induced dynamic electron polarization	DFT	density functional theory
CIDNP	chemically induced dynamic nuclear polarization	diam	diameter
cir	circular	dil	dilute, dilution
CKFF	Cotton-Kraihanzel force field	DIM	diatomics in molecules
CL	cathode luminescence	dm	decimeter
cm	centimeter	dmf, DMF	<i>N,N</i> -dimethylformamide
c.m.	center of mass	dms _o , DMSO	dimethylsulfoxide
c.m.c.	critical micelle concentration	DNA	deoxyribonucleic acid
CMO	canonical molecular orbital	DNase	deoxyribonuclease
CMP	cytidine 5'-monophosphate	DNMR	dynamic nuclear magnetic resonance
CN	coordination number	DOS	density of states
CNDO	complete neglect of differential overlap	doz	dozen
<i>Co</i>	Cowling number	d.p.	degree of polymerization
COD	chemical oxygen demand	dpl	displacement
conc	concentrated, concentration	dpm	disintegrations per minute
const	constant	dps	disintegrations per second
cos	cosine	dr	dram
cosh	hyperbolic cosine	dRib	2-deoxyribose
COSY	correlation spectroscopy (in NMR)	DRIFT	diffuse reflectance infrared Fourier transform
cot	cotangent	DRS	diffuse reflectance spectroscopy
coth	hyperbolic cotangent	DSC	differential scanning calorimetry
cp	candle power	DTA	differential thermal analysis
cP	centipoise	dyn	dyne
Cp	cyclopentadienyl	e	electron, base of natural logarithms
CP	chemically pure	<i>e</i>	elementary charge, linear strain
CPA	coherent potential approximation	<i>E</i>	electric field strength, electromotive force, energy, modulus of elasticity, entgegen (<i>trans</i> configuration)
cpd	contact potential difference	<i>E_h</i>	Hartree energy
cps	cycles per second	EA	electron affinity
CPT	charge conjugation-space inversion-time reversal (theorem)	EAN	effective atomic number
CPU	central processing unit	ECP	effective core potential
cr, cryst	crystalline (phase)	ECR	electron cyclotron resonance
CRU	constitutional repeating unit	ED	electron diffraction, effective dose
csc	cosecant	EDS	energy dispersive X-ray spectroscopy
ct	carat	EDTA	ethylenediaminetetraacetic acid
CT	charge transfer	EELS	electron energy loss spectroscopy
CTEM	conventional transmission electron microscopy	EFFF	energy factored force field
CTP	cytidine 5'-triphosphate	EHMO	extended Hückel molecular orbital
CTR	controlled thermonuclear reaction	EHT	extended Hückel theory
cu	cubic	emf	electromotive force
CV	cyclic voltammetry	emu	electromagnetic unit system
CVD	chemical vapor deposition	en	ethylenediamine
cw	continuous wave		

SCIENTIFIC ABBREVIATIONS AND SYMBOLS (continued)

ENDOR	electron-nuclear double resonance	G	gauss, guanine (in genetic code)
EOS	equation of state	<i>G</i>	electrical conductance, Gibbs energy, gravitational constant, shear modulus
EPMA	electron probe microanalysis	gal	gallon
EPR	electron paramagnetic (spin) resonance	Gal	gal, galileo, galactose
eq, eqn	equation	GalN	galactosamine
<i>eqQ</i>	quadrupole coupling constant	GC	gas chromatography
erf	error function	GC-MS	gas chromatography-mass spectrometry
erg	erg	GDMS	glow discharge mass spectroscopy
ESCA	electron spectroscopy for chemical analysis	<i>gem</i>	geminal (on the same carbon atom)
e.s.d.	estimated standard deviation	GeV	gigaelectronvolt
ESD	electron stimulated desorption	GIAO	gauge invariant atomic orbital
ESR	electron spin resonance	gl	glacial
est	estimate, estimated	GLC	gas-liquid chromatography
esu	electrostatic unit system	Glc	glucose
Et	ethyl	GlcN	glucosamine
ET	electron transfer, ephemeris time	Glc-ol	glucitol
Et ₂ O	diethyl ether	Gln	glutamine
e.u.	entropy unit	Glu	glutamic acid
<i>Eu</i>	Euler number	Gly	glycine
eV	electronvolt	GMP	guanosine 5'-triphosphate
EWG	electron withdrawing group	GMT	Greenwich mean time
EXAFS	extended x-ray absorption fine structure	gpm	gallons per minute
EXELFS	extended energy loss fine structure	gps	gallons per second
exp	exponential function	gr	grain
expt	experimental	<i>Gr</i>	Grashof number
ext	external	GTO	gaussian type atomic orbital
<i>f</i>	formation reaction	Gua	guanine
<i>f</i>	activity coefficient, aperture ratio, focal length, force constant, frequency, fugacity	Gul	gulose
F	farad	GUT	grand unified theory
°F	degree Fahrenheit	GVB	generalized valence bond
<i>F</i>	Faraday constant, force, angular momentum	GWS	Glashow-Weinberg-Salam (theory)
FAD	flavin adenine dinucleotide	Gy	gray, gigayear
fcc	face centered cubic	h	helion, hour
FEL	free electron laser	<i>h</i>	Planck constant
FEM	field emission microscopy	H	henry
FEMO	free electron molecular orbital	<i>H</i>	enthalpy, Hamiltonian function, magnetic field
FET	field effect transistor	<i>H</i> ₀	Hubble constant
fid	free induction decay	ha	hectare
FIM	field ion microscopy	<i>Ha</i>	Hartmann number
FIR	far infrared	Hacac	acetylacetone
fl	fluid (phase)	HAM	hydrogenic atoms in molecules
FM	frequency modulation	hav	haversine
<i>Fo</i>	Fourier number	Hb	hemoglobin
fp	freezing point	hcp	hexagonal closed packed
fpm	feet per minute	Hea	ethanolamine
fps	feet per second, foot-pound-second system	HEIS	high energy ion scattering
Fr	franklin	HEP	high energy physics
<i>Fr</i>	Froude number	HF	high frequency
Fru	fructose	hfs	hyperfine structure
FSGO	floating spherical Gaussian orbital	Him	imidazole
ft	foot	His	histidine
ft-lb	foot pound	HMO	Hückel molecular orbital
FT	Fourier transform	HOMO	highest occupied molecular orbital
FTIR	Fourier transform infrared spectroscopy	hp	horsepower
Fuc	fucose	HPLC	high-performance liquid chromatography
Fuc-ol	fucitol	Hpz	pyrazole
fus	fusion (melting)	hr	hour
g	gram, gas	HREELS	high resolution electron energy loss spectroscopy
<i>g</i>	acceleration due to gravity, degeneracy, statistical weight, Landé <i>g</i> -factor	HREM	high resolution electron microscopy
		HSAB	hard-soft acid-base (theory)

SCIENTIFIC ABBREVIATIONS AND SYMBOLS (continued)

HSE	homodesmotic stabilization energy	kPa	kilopascal
Hz	hertz	kt	karat
<i>i</i>	square root of minus one	kV	kilovolt
<i>I</i>	electric current, ionic strength, moment of inertia, nuclear spin angular momentum, radiant intensity	kva	kilovolt ampere
IAT	international atomic time	kW	kilowatt
<i>i</i> -Bu	isobutyl	kwh	kilowatt hour
IC	integrated circuit	l	liquid, liter
ICP	inductively coupled plasma	<i>l</i>	angular momentum, length, levorotatory
ICR	ion cyclotron resonance	L	liter, lambert
id	ideal (solution)	<i>L</i>	Avogadro constant, inductance, Lagrange function
ID	inside diameter	lat.	latitude
Ido	idose	lb	pound
IDP	inosine 5'-diphosphate	lbf	pound force
IE	ionization energy	lc	liquid crystal
i.e.p.	isoelectric point	LC	liquid chromatography
IEPA	independent electron pair approximation	LCAO	linear combination of atomic orbitals
IF	intermediate frequency	LD	lethal dose
IGLO	individual gauge for localized orbitals	<i>Le</i>	Lewis function
Ile	isoleucine	LED	light emitting diode
Im	imaginary part	LEED	low-energy electron diffraction
imm	immersion	LEIS	low energy ion scattering
IMPATT	impact ionization avalanche transit time	Leu	leucine
in.	inch	LFER	linear free energy relationship
INDO	intermediate neglect of differential overlap	lim	limit
INS	inelastic neutron scattering, ion neutralization spectroscopy	LIMS	laser ionization mass spectroscopy, laboratory information management system
int	internal	liq	liquid
I/O	input/output	lm	lumen
IP	ionization potential	ln	logarithm (natural)
IPN	interpenetrating polymer network	LNDO	local neglect of differential overlap
<i>i</i> -Pr	isopropyl	log	logarithm (common)
IPR	isotopic perturbation of resonance	long.	longitude
IPTS	International Practical Temperature Scale	LST	local sidereal time
IR	infrared	LT	local time
IRAS	reflection-absorption infrared spectroscopy	LTE	local thermodynamic equilibrium
IRC	intrinsic reaction coordinate	LUMO	lowest unoccupied molecular orbital
isc	intersystem crossing	lut	lutidine
ISE	isodesmic stabilization energy	lx	lux
ISS	ion scattering spectroscopy	ly	langley
ITP	inosine 5'-triphosphate	l.y.	light year
ITS	International Temperature Scale (1990)	Lys	lysine
IU	international unit	Lyx	lyxose
<i>j</i>	angular momentum, electric current density	m	meter, molal (as in 0.1 m solution), metastable (isotope)
J	joule	<i>m</i>	magnetic dipole moment, mass, molality, angular momentum component, <i>meta</i> (as chemical descriptor)
<i>J</i>	angular momentum, electric current density, flux, Massieu function	M	molar (as in 0.1 M solution), metal (in chemical formulas)
<i>k</i>	absorption index, Boltzmann constant, rate constant, thermal conductivity, wave vector	<i>M</i>	magnetization, molar mass, mutual inductance, torque, angular momentum component
K	kelvin	<i>M_r</i>	molecular weight (relative molar mass)
<i>K</i>	absorption coefficient, bulk modulus, equilibrium constant, kinetic energy	<i>Ma</i>	Mach number
kb	kilobar, kilobase (DNA or RNA)	Man	mannose
kcal	kilocalorie	MASNMR	magic angle spinning nuclear magnetic resonance
KE	kinetic energy	max	maximum
keV	kiloelectronvolt	MBE	molecular beam epitaxy
kg	kilogram	MBPT	many body perturbation theory
kgf	kilogram force	MC	Monte Carlo (method)
kJ	kilojoule	MCD	magnetic circular dichroism
km	kilometer	MCPF	modified couple pair functional
<i>Kn</i>	Knudsen number	MCSCF	multi-configurational self-consistent field

SCIENTIFIC ABBREVIATIONS AND SYMBOLS (continued)

MD	molecular dynamics	NEXAFS	near-edge x-ray absorption fine structure
Me	methyl	ng	nanogram
MEP	molecular electrostatic potential	NIR	near infrared
MERP	minimum energy reaction path	nm	nanometer
Mes	mesityl	NMR	nuclear magnetic resonance
MESFET	metal-semiconductor field-effect transistor	NNDO	neglect of nonbonded differential overlap
Met	methionine	NO	natural orbital
meV	millielectronvolt	NOE	nuclear Overhauser effect
MeV	megaelectronvolt	NPA	natural population analysis
MF	molecular formula	NQR	nuclear quadrupole resonance
mg	milligram	NRA	prompt nuclear reaction analysis
MHD	magnetohydrodynamics	ns	nanosecond
mi	mile	NTP	normal temperature and pressure
MIM	molecules-in-molecules	Nu	nucleophile
min	minimum, minute	<i>Nu</i>	Nusselt number
MINDO	modified intermediate neglect of differential overlap	<i>o</i>	<i>ortho</i> (as chemical descriptor)
MIR	mid-infrared	obs, obsd	observed
misc	miscible	OD	optical density, outside diameter
MKS	meter-kilogram-second system	Oe	oersted
MKSA	meter-kilogram-second-ampere system	ORD	optical rotatory dispersion
mL, ml	milliliter	<i>oz</i>	ounce
mm	millimeter	<i>p</i>	proton
MM	molecular mechanics	<i>p</i>	dielectric polarization, electric dipole moment, momentum, pressure, <i>para</i> (as chemical descriptor)
mmf	magnetomotive force	<i>P</i>	poise
mmHg	millimeter of mercury	<i>P</i>	power, pressure, probability, sound energy flux
MO	molecular orbital	Pa	pascal
mol	mole	PA	proton affinity
mol.wt.	molecular weight	PAS	photoacoustic spectroscopy
mon	monomeric form	pc	parsec
MOS	metal-oxide semiconductor	PCR	polymerase chain reaction
MOSFET	metal-oxide semiconductor field-effect transistor	PD	potential difference
mp	melting point	pdl	poundal
MPa	megapascal	pe	probable error
MPA	Mulliken population analysis	<i>Pe</i>	Péclet number
Mpc	megaparsec	PES	photoelectron spectroscopy
MRI	magnetic resonance imaging	PET	positron emission tomography
mRNA	messenger RNA	peth	petroleum ether
ms	millisecond	pf	power factor
MS	mass spectroscopy	pg	picogram
MSL	mean sea level	pH	negative log of hydrogen ion concentration
Mur	muramic acid	Ph	phenyl
mV	millivolt	Phe	phenylalanine
mW	milliwatt	pI	isoelectric point
MW	megawatt, microwave, molecular weight	pip	piperidine
Mx	maxwell	<i>pK</i>	negative log of ionization constant
<i>n</i>	neutron	pm	picometer
<i>n</i>	amount of substance, number density, principal quantum number, refractive index, normal (in chemical formulas)	PMO	perturbational molecular orbital
<i>N</i>	newton	PNDO	partial neglect of differential overlap
<i>N</i>	angular momentum, neutron number	PNRA	prompt nuclear reaction analysis
N_A	Avogadro constant	pol	polymeric form
N_E	density of states	ppb	parts per billion
NAA	neutron activation analysis	ppm	parts per million
NAD	nicotinamide adenine dinucleotide	PPP	Pariser-Parr-Pople (method)
NADH	reduced NAD	ppt	parts per thousand, precipitate
NADP	nicotinamide adenine dinucleotide phosphate	Pr	propyl
NAO	natural atomic orbital	<i>Pr</i>	Prandtl number
NBO	natural bond order	PRDDO	partial retention of diatomic differential overlap
nbp	normal boiling point	Pro	proline
Neu	neuraminic acid	ps	picosecond
		PS	photoelectron spectroscopy

SCIENTIFIC ABBREVIATIONS AND SYMBOLS (continued)

PSD	photon stimulated desorption	S	siemens
Psi	psicose	<i>S</i>	area, entropy, probability current density, Poynting vector, symmetry coordinate, spin angular momentum
psi	pounds per square inch	SALC	symmetry adapted linear combinations
psia	pounds per square inch absolute	SALI	surface analysis by laser ionization
psig	pounds per square inch gage	SAM	scanning Auger microscopy
pt	pint	SANS	small angle neutron scattering
PVT	pressure-volume-temperature	Sar	sarcosine
py	pyridine	sat, satd	saturated
<i>q</i>	electric field gradient, flow rate, heat, wave vector (phonons)	SAXS	small angle x-ray scattering
<i>Q</i>	electric charge, heat, partition function, quadrupole moment, radiant energy, vibrational normal coordinate	<i>s</i> -Bu	<i>sec</i> -butyl
QCD	quantum chromodynamics	<i>Sc</i>	Schmidt number
QED	quantum electrodynamics	SCE	saturated calomel electrode
Q.E.D.	quod erat demonstrandum (which was to be proved)	SCF	self-consistent field
QSAR	quantitative structure-activity relationship	SCR	silicon-controlled rectifier
QSO	quasi-stellar object (quasar)	sd	standard deviation
qt	quart	sec	secant, second
quad	quadrillion Btu (= 1.05510 ¹⁸ J)	<i>sec</i>	secondary (in chemical name)
Qui	quinovose	SEELFS	surface sensitive energy loss fine structure
q.v.	quod vide (which you should see)	SEM	scanning electron microscope
r	reaction	sepn	separation
<i>r</i>	position vector, radius	Ser	serine
R	roentgen, alkyl radical (in chemical formulas)	SERS	surface-enhanced Raman spectroscopy
°R	degree Rankine	SET	single electron transfer
<i>R</i>	electrical resistance, gas constant, molar refraction, Rydberg constant	SEXAFS	surface extended x-ray absorption fine structure
RA	right ascension	<i>Sh</i>	Sherwood number
rad	radian	SI	International System of Units
RAIRS	reflection-absorption infrared spectroscopy	SIMS	secondary ion mass spectroscopy
RAM	random access memory	sin	sine
RBS	Rutherford backscattering spectroscopy	SINDO	symmetrically orthogonalized INDO method
RE	resonance energy	sinh	hyperbolic sine
Re	real part	SIPN	semi-interpenetrating polymer network
RED	radial electron distribution	SLAM	scanning laser acoustic microscopy
REM	reflection electron microscopy	sln	solution
rem	roentgen equivalent man	SMO	semiempirical molecular orbital
RF	radiofrequency	SMOW	Standard Mean Ocean Water
Rha	rhamnose	SNMS	sputtered neutral mass spectroscopy
RHEED	reflection high-energy electron diffraction	SNU	solar neutrino unit
RHF	restricted Hartree-Fock (theory)	SO	spin orbital
RIA	radioimmunoassay	sol	soluble, solution
Rib	ribose	soln	solution
Ribulo	ribulose	SOMO	singly occupied molecular orbital
rms	root mean square	Sor	sorbose
RNA	ribonucleic acid	sp gr	specific gravity
RNase	ribonuclease	SPM	scanned probe microscopy
rRNA	ribosomal RNA	sq	square
ROHF	restricted open shell Hartree-Fock	sr	steradian
ROM	read only memory	<i>Sr</i>	Strouhal number
RPA	random phase approximation	SSMS	spark source mass spectroscopy
rpm	revolutions per minute	St	stoke
rps	revolutions per second	<i>St</i>	Stanton number
RRK	Rice-Ramsperger-Kassel (theory)	std, stnd	standard (state)
RRKM	Rice-Ramsperger-Kassel-Marcus (theory)	STEM	scanning transmission electron microscope
RRS	resonance Raman spectroscopy	STM	scanning tunneling microscopy
RS	Raman spectroscopy	STO	Slater type orbital
Ry	rydberg	STP	standard temperature and pressure
s	second, solid	sub	sublimation, sublimes
<i>s</i>	path length, solubility, spin angular momentum, symmetry number, symmetrical (as stereochemical descriptor)	Sv	sievert
		t	metric tonne, triton
		<i>t</i>	Celsius temperature, thickness, time, transport number
		T	tesla

SCIENTIFIC ABBREVIATIONS AND SYMBOLS (continued)

<i>T</i>	kinetic energy, period, term value, temperature (thermodynamic), torque, transmittance	<i>vic</i>	vicinal (on adjacent carbon atoms)
Tag	tagatose	VIS	visible region of the spectrum
Tal	talose	vit	vitreous
tan	tangent	VSEPR	valence shell electron pair repulsion
tanh	hyperbolic tangent	VSLI	very large scale integrated (circuit)
<i>t</i> -Bu	<i>tert</i> -butyl	VUV	vacuum ultraviolet
TCA	trichloroacetic acid	v/v	volume per volume (volume of solute divided by volume of solution, expressed as percent)
TCE	trichloroethylene	<i>w</i>	energy density, mass fraction, velocity, work
tcne	tetracyanoethylene	W	watt
TCSCF	two configuration self-consistent field	<i>W</i>	radiant energy, statistical weight, work
TE	transverse electric	WAXS	wide angle x-ray scattering
TED	transmission electron diffraction, transferred electron device	Wb	weber
TEM	transmission electron microscopy, transverse electromagnetic	<i>W_e</i>	Weber number
temp	temperature	WKB	Wentzel-Kramers-Brillouin (method)
<i>tert</i>	tertiary (in chemical name)	wt	weight
TFD	Thomas-Fermi-Dirac (method)	w/v	weight per volume (mass of solute divided by volume of solution, generally expressed as g/100 mL)
TGA	thermo-gravimetric analysis	w/w	weight per weight (mass of solute divided by mass of solution, expressed as percent)
theor	theoretical	<i>x</i>	mole fraction
thf, THF	tetrahydrofuran	X	X unit, halogen (in chemical formula)
Thr	threonine	<i>X</i>	reactance
Thy	thymine	XAFS	x-ray absorption fine structure
TL	thermoluminescence	XANES	x-ray absorption near-edge structure
TLC	thin-layer chromatography	XPES	x-ray photoelectron spectroscopy
TM	transverse magnetic	XPS	x-ray photoelectron spectroscopy
Tol	tolyl	XRD	x-ray diffraction
Torr	torr	XRF	x-ray fluorescence
tRNA	transfer RNA	XRS	x-ray spectroscopy
Trp	tryptophan	Xyl	xylose
trs	transition	y, yr	year
TS	transition state	Y	admittance, Planck function, Young's modulus
tsp	teaspoon	yd	yard
Tyr	tyrosine	<i>z</i>	charge number (of an ion), collision frequency factor
u	unified atomic mass unit	Z	atomic number, compression factor, collision number, impedance, partition function, zusammen (<i>cis</i> configuration)
<i>u</i>	Bloch function, electric mobility, velocity	ZDO	zero differential overlap
U	uracil (in genetic code)	ZPE, ZPVE	zero point vibrational energy
<i>U</i>	electric potential difference, internal energy	ZULU	Greenwich mean time
UDP	uridine 5'-diphosphate	α	alpha particle
UHF	ultrahigh frequency, unrestricted Hartree-Fock (theory)	α	absorption coefficient, degree of dissociation, electric polarizability, expansion coefficient, fine structure constant
UMP	uridine 5'-monophosphate	β	beta particle
<i>uns, unsym</i>	unsymmetrical (as chemical descriptor)	γ	photon
UPES	ultraviolet photoelectron spectroscopy	γ	activity coefficient, conductivity, magnetogyric ratio, mass concentration, ratio of heat capacities, surface tension
UPS	ultraviolet photoelectron spectroscopy	Γ	Grüneisen parameter, level width, surface concentration
ur	urea	δ	chemical shift, Dirac delta function, Kronecker delta, loss angle
Ura	uracil	Δ	inertia defect, mass defect
USP	United States Pharmacopeia	ϵ	emittance, Levi-Civita symbol, linear strain, molar absorption coefficient, permittivity
UT	universal time	η	overpotential, viscosity
UTP	uridine 5'-triphosphate	θ	Bragg angle, temperature, scattering angle, surface coverage
UV	ultraviolet	Θ	quadrupole moment
<i>v</i>	reaction rate, specific volume, velocity, vibrational quantum number, vicinal (as chemical descriptor)		
V	volt		
<i>V</i>	electric potential, potential energy, volume		
Val	valine		
vap	vaporization		
VB	valence band, valence bond		
VCD	vibrational circular dichroism		
VHF	very high frequency		

SCIENTIFIC ABBREVIATIONS AND SYMBOLS (continued)

κ	compressibility, conductivity, magnetic susceptibility, molar absorption coefficient, transmission coefficient	ρ	density, reflectance, resistivity
λ	absolute activity, radioactive decay constant, thermal conductivity, wavelength	σ	electrical conductivity, cross section, normal stress, shielding constant (NMR), Stefan-Boltzmann constant, surface tension
Λ	angular momentum, ionic conductivity	τ	transmittance, chemical shift, shear stress, relaxation time
μ	muon	ϕ	electrical potential, fugacity coefficient, osmotic coefficient, quantum yield, volume fraction, wavefunction
μ	chemical potential, electric dipole moment, electric mobility, friction coefficient, Joule-Thompson coefficient, magnetic dipole moment, mobility, permeability	Φ	magnetic flux, potential energy, radiant power, work function
μF	microfarad	χ	magnetic susceptibility, electronegativity
μg	microgram	χ_e	electric susceptibility
μm	micrometer	Ψ	wavefunction
μs	microsecond	ω	circular frequency, angular velocity, harmonic vibration wavenumber, statistical weight
ν	frequency, kinematic velocity, stoichiometric number, wavenumber	Ω	ohm
ν_e	neutrino	Ω	axial angular momentum, solid angle
π	pion		
Π	osmotic pressure, Peltier coefficient		

GREEK, RUSSIAN, AND HEBREW ALPHABETS

The following table presents the Hebrew, Greek, and Russian alphabets, their letters, the names of the letters, and the English equivalents.

HEBREW ^{1,3}			GREEK ⁴			RUSSIAN		
א	aleph	' ²	Α α	alpha	a	А а		a
ב	beth	b, bh	Β β	beta	b	Б б		b
ג	gimel	g, gh	Γ γ	gamma	g, n	В в		v
ד	daleth	d, dh	Δ δ	delta	d	Г г		g
ה	he	h	Ε ε	epsilon	e	Д д		d
ו	waw	w	Ζ ζ	zeta	z	Е е		e
ז	zayin	z	Ζ ζ	zeta	z	Ж ж		zh
ח	heth	h	Η η	eta	ē	З з		z
ט	teth	t	Θ θ	theta	th	И и	Й й	ī, ī
י	yodh	y	Ι ι	iota	i	К к		k
כ	kaph	k, kh	Κ κ	kappa	k	Л л		l
ל	lamedh	l	Λ λ	lambda	l	М м		m
מ	mem	m	Μ μ	mu	m	Н н		n
נ	nun	n	Ν ν	nu	n	О о		o
ס	samekh	s	Ξ ξ	xi	x	П п		p
ע	ayin	'	Ο ο	omicron	o	Р р		r
פ	pe	p, ph	Π π	pi	p	С с		s
צ	sadhe	ś	Ρ ρ	rho	r, rh	Т т		t
ק	qoph	q	Σ σ	sigma	s	У у		u
ר	resh	r	Π π	pi	p	Ф ф		f
ש	sin	ś	Ρ ρ	rho	r, rh	Х х		kh
שׁ	shin	sh	Σ σ	sigma	s	Ц ц		ts
ת	taw	t, th	Τ τ	tau	t	Ч ч		ch
			Τ υ	upsilon	y, u	Ш ш		sh
			Φ φ	phi	ph	Щ щ		shch
			Υ υ	upsilon	y, u	Ъ ъ	⁵	''
			Φ φ	phi	ph	Ы ы		y
			Χ χ	chi	ch	Ь ь	⁶	'
			Ψ ψ	psi	ps	Э э		e
			Ω ω	omega	ō	Ю ю		yu
						Я я		ya

¹ Where two forms of a letter are given, the second one is the form used at the end of a word.

² Not represented in transliteration when initial.

³ The Hebrew letters are primarily consonants; a few of them are also used secondarily to represent certain vowels, when provided at all, is by means of a system of dots or strokes adjacent to the consonated characters.

⁴ The letter gamma is transliterated "n" only before velars; the letter upsilon is transliterated "u" only as the final element in diphthongs.

⁵ This sign indicates that the immediately preceding consonant is not palatized even though immediately followed by a palatized vowel.

⁶ This sign indicates that the immediately preceding consonant is palatized even though not immediately followed by a palatized vowel.

DEFINITIONS OF SCIENTIFIC TERMS

Brief definitions of selected terms of importance in chemistry, physics, and related fields of science are given in this section. The selection process emphasizes the following types of terms:

- Physical quantities
- Units of measure
- Classes of chemical compounds and materials
- Important theories, laws, and basic concepts.

Individual chemical compounds are not included.

Definitions have taken wherever possible from the recommendations of international or national bodies, especially the International Union of Pure and Applied Chemistry (IUPAC) and International Organization for Standardization (ISO). For physical quantities and units, the recommended symbol is also given. The source of such definitions is indicated by the reference number in brackets following the definition. In many cases these official definitions have been edited in the interest of stylistic consistency and economy of space. The user is referred to the original source for further details.

* An asterisk following a term indicates that further information can be found by consulting the index of this handbook under the entry for that term.

Ab initio method - An approach to quantum-mechanical calculations on molecules which starts with the Schrödinger equation and carries out a complete integration, without introducing empirical factors derived from experimental measurement.

Absorbance (A) - Defined as $-\log(1-\alpha) = \log(1/\tau)$, where α is the absorbance and τ the transmittance of a medium through which a light beam passes. [2]

Absorbed dose (D) - For any ionizing radiation, the mean energy imparted to an element of irradiated matter divided by the mass of that element. [1]

Absorptance (α) - Ratio of the radiant or luminous flux in a given spectral interval absorbed in a medium to that of the incident radiation. Also called absorption factor. [1]

Absorption coefficient (a) - The relative decrease in the intensity of a collimated beam of electromagnetic radiation, as a result of absorption by a medium, during traversal of an infinitesimal layer of the medium, divided by the length traversed. [1]

Absorption coefficient, molar (ϵ) - Absorption coefficient divided by amount-of-substance concentration of the absorbing material in the sample solution ($\epsilon = a/c$). The SI unit is m^2/mol . Also called extinction coefficient, but usually in units of $\text{mol}^{-1}\text{dm}^3\text{cm}^{-1}$. [2]

Acceleration - Rate of change of velocity with respect to time.

Acceleration due to gravity (g)* - The standard value (9.80665 m/s^2) of the acceleration experienced by a body in the earth's gravitational field. [1]

Acenenes - Polycyclic aromatic hydrocarbons consisting of fused benzene rings in a rectilinear arrangement. [5]

Acid - Historically, a substance that yields an H^+ ion when it dissociates in solution, resulting in a $\text{pH} < 7$. In the Brønsted definition, an acid is a substance that donates a proton in any type of reaction. The most general definition, due to G.N. Lewis, classifies any chemical species capable of accepting an electron pair as an acid.

Acid dissociation constant (K_a)* - The equilibrium constant for the dissociation of an acid HA through the reaction $\text{HA} + \text{H}_2\text{O} \rightleftharpoons \text{A}^- + \text{H}_3\text{O}^+$. The quantity $\text{p}K_a = -\log K_a$ is often used to express the acid dissociation constant.

Actinides - The elements of atomic number 89 through 103, e.g., Ac, Th, Pa, U, Np, Pu, Am, Cm, Bk, Cf, Es, Fm, Md, No, Lr. [7]

Activation energy* - In general, the energy that must be added to a system in order for a process to occur, even though the process may already be thermodynamically possible. In chemical kinetics, the activation energy is the height of the potential barrier separating the products and reactants. It determines the temperature dependence of the reaction rate.

Activity - For a mixture of substances, the absolute activity λ of substance B is defined as $\lambda_B = \exp(\mu_B/RT)$, where μ_B is the chemical potential of substance B, R the gas constant, and T the thermodynamic temperature. The relative activity a is defined as $a_B = \exp[(\mu_B - \mu_B^\circ)/RT]$, where μ_B° designates the chemical potential in the standard state. [2]

Activity coefficient (γ)* - Ratio of the activity a_B of component B of a mixture to the concentration of that component. The value of γ depends on the method of stating the composition. For mole fraction x_B , the relation is $a_B = \gamma_B x_B$; for molarity c_B , it is $a_B = \gamma_B c_B/c^\circ$, where c° is the standard state composition (typically chosen as 1 mol/L); for molality

DEFINITIONS OF SCIENTIFIC TERMS (continued)

- m_B , it is $a_B = \gamma_B m_B / m^\circ$, where m° is the standard state molality (typically 1 mol/kg). [2]
- Activity, of radioactive substance (A)** - The average number of spontaneous nuclear transitions from a particular energy state occurring in an amount of a radionuclide in a small time interval divided by that interval. [1]
- Acyl groups** - Groups formed by removing the hydroxy groups from oxoacids that have the general structure $RC(=O)(OH)$ and replacement analogues of such acyl groups. [5]
- Adiabatic process** - A thermodynamic process in which no heat enters or leaves the system.
- Admittance (Y)** - Reciprocal of impedance. $Y = G + iB$, where G is conductance and B is susceptance. [1]
- Adsorption** - A process in which molecules of gas, of dissolved substances in liquids, or of liquids adhere in an extremely thin layer to surfaces of solid bodies with which they are in contact. [10]
- Albedo*** - The ratio of the light reflected or scattered from a surface to the intensity of incident light. The term is often used in reference to specific types of terrain or to entire planets.
- Alcohols** - Compounds in which a hydroxy group, $-OH$, is attached to a saturated carbon atom. [5]
- Aldehydes** - Compounds $RC(=O)H$, in which a carbonyl group is bonded to one hydrogen atom and to one R group. [5]
- Aldoses** - Aldehydic parent sugars (polyhydroxyaldehydes $H[CH(OH)]_n C(=O)H$, $n > 1$) and their intramolecular hemiacetals. [5]
- Alloximes** - Oximes of aldehydes: $RCH=NOH$. [5]
- Alfvén number (Al)** - A dimensionless quantity used in plasma physics, defined by $Al = v(\rho\mu)^{1/2}/B$, where ρ is density, v is velocity, μ is permeability, and B is magnetic flux density. [2]
- Alfvén waves** - Very low frequency waves which can exist in a plasma in the presence of a uniform magnetic field. Also called magnetohydrodynamic waves.
- Alicyclic compounds** - Aliphatic compounds having a carbocyclic ring structure which may be saturated or unsaturated, but may not be a benzenoid or other aromatic system. [5]
- Aliphatic compounds** - Acyclic or cyclic, saturated or unsaturated carbon compounds, excluding aromatic compounds. [5]
- Alkali metals** - The elements lithium, sodium, potassium, rubidium, cesium, and francium.
- Alkaline earth metals** - The elements calcium, strontium, barium, and radium. [7]
- Alkaloids** - Basic nitrogen compounds (mostly heterocyclic) occurring mostly in the plant kingdom (but not excluding those of animal origin). Amino acids, peptides, proteins, nucleotides, nucleic acids, and amino sugars are not normally regarded as alkaloids. [5]
- Alkanes** - Acyclic branched or unbranched hydrocarbons having the general formula $C_n H_{2n+2}$, and therefore consisting entirely of hydrogen atoms and saturated carbon atoms. [5]
- Alkenes** - Acyclic branched or unbranched hydrocarbons having one carbon-carbon double bond and the general formula $C_n H_{2n}$. Acyclic branched or unbranched hydrocarbons having more than one double bond are alkadienes, alkatrienes, etc. [5]
- Alkoxides** - Compounds, ROM, derivatives of alcohols, ROH, in which R is saturated at the site of its attachment to oxygen and M is a metal or other cationic species. [5]
- Alkyl groups** - Univalent groups derived from alkanes by removal of a hydrogen atom from any carbon atom: $C_n H_{2n+1}$ -. The groups derived by removal of a hydrogen atom from a terminal carbon atom of unbranched alkanes form a subclass of normal alkyl (n -alkyl) groups. The groups RCH_2 -, R_2CH -, and R_3C - (R not equal to H) are primary, secondary, and tertiary alkyl groups, respectively. [5]
- Alkynes** - Acyclic branched or unbranched hydrocarbons having a carbon-carbon triple bond and the general formula $C_n H_{2n-2}$, $RC\equiv CR'$. Acyclic branched or unbranched hydrocarbons having more than one triple bond are known as alkadiynes, alkatriynes, etc. [5]
- Allotropy** - The occurrence of an element in two or more crystalline forms.
- Allylic groups** - The group $CH_2=CHCH_2$ - (allyl) and derivatives formed by substitution. The term 'allylic position' or 'allylic site' refers to the saturated carbon atom. A group, such as $-OH$, attached at an allylic site is sometimes described as "allylic". [5]
- Amagat volume unit** - A non-SI unit previously used in high pressure science. It is defined as the molar volume of a real gas at one atmosphere pressure and 273.15 K. The approximate value is 22.4 L/mol.
- Amides** - Derivatives of oxoacids $R(C=O)(OH)$ in which the hydroxy group has been replaced by an amino or substituted amino group. [5]
- Amine oxides** - Compounds derived from tertiary amines by the attachment of one oxygen atom to the nitrogen atom: $R_3N^+-O^-$. By extension the term includes the analogous derivatives of primary and secondary amines. [5]
- Amines** - Compounds formally derived from ammonia by replacing one, two, or three hydrogen atoms by hydrocarbyl groups, and having the general structures RNH_2 (primary amines), R_2NH (secondary amines), R_3N (tertiary amines). [5]
- Amino acids*** - Compounds containing both a carboxylic acid group ($-COOH$) and an amino group ($-NH_2$). The most important are the α -amino acids, in which the $-NH_2$ group is attached to the C atom adjacent to the $-COOH$ group. In the β -amino acids, there is an intervening carbon atom. [4]
- Ampere (A)*** - The SI base unit of electric current. [1]
- Ampere's law** - The defining equation for the magnetic induction B , viz., $dF = Idl \times B$, where dF is the force produced by a current I flowing in an element of the conductor dl pointing in the direction of the current.
- Ångström (Å)** - A unit of length used in spectroscopy, crystallography, and molecular structure, equal to 10^{-10} m.
- Angular momentum (L)** - The angular momentum of a particle about a point is the vector product of the radius vector from this point to the particle and the momentum of the particle; i.e., $L = r \times p$. [1]
- Angular velocity (ω)** - The angle through which a body rotates per unit time.
- Anilides** - Compounds derived from oxoacids $R(C=O)(OH)$ by replacing the $-OH$ group by the $-NHPh$ group or derivative formed by ring substitution. Also used for salts formed by replacement of a nitrogen-bound hydrogen of aniline by a metal. [5]
- Anion** - A negatively charged atomic or molecular particle.
- Antiferroelectricity*** - An effect analogous to antiferromagnetism in which electric dipoles in a crystal are ordered in two sublattices that are polarized in opposite directions, leading to zero net polarization. The effect vanishes above a critical temperature.
- Antiferromagnetism*** - A type of magnetism in which the magnetic moments of atoms in a solid are ordered into two antiparallel aligned sublattices. Antiferromagnets are characterized by a zero or small positive magnetic susceptibility. The susceptibility increases with temperature up to a critical value, the Néel temperature, above which the material becomes paramagnetic.
- Antiparticle** - A particle having the same mass as a given elementary particle and a charge equal in magnitude but opposite in sign.
- Appearance potential*** - The lowest energy which must be imparted to the parent molecule to cause it to produce a particular specified parent ion. This energy, usually stated in eV, may be imparted by electron impact, photon impact, or in other ways. More properly called appearance energy. [3]
- Appearance potential spectroscopy (APS)** - See Techniques for Materials Characterization, page 12-1.
- Are (a)** - A unit of area equal to 100 m². [1]

DEFINITIONS OF SCIENTIFIC TERMS (continued)

- Arenes** - Monocyclic and polycyclic aromatic hydrocarbons. See aromatic compounds. [5]
- Aromatic compounds** - Compounds whose structure includes a cyclic delocalized π -electron system. Historical use of the term implies a ring containing only carbon (e.g., benzene, naphthalene), but it is often generalized to include heterocyclic structures such as pyridine and thiophene. [5]
- Arrhenius equation** - A key equation in chemical kinetics which expresses the rate constant k as $k = A \exp(-E_a/RT)$, where E_a is the activation energy, R the molar gas constant, and T the temperature. A is called the preexponential factor and, for simple gas phase reactions, may be identified with the collision frequency.
- Arsines** - AsH_3 and compounds derived from it by substituting one, two or three hydrogen atoms by hydrocarbyl groups. $RAsH_2$, R_2AsH , R_3As (R not equal to H) are called primary, secondary and tertiary arsines, respectively. [5]
- Aryl groups** - Groups derived from arenes by removal of a hydrogen atom from a ring carbon atom. Groups similarly derived from heteroarenes are sometimes subsumed in this definition. [5]
- Astronomical unit (AU)*** - The mean distance of the earth from the sun, equal to $1.49597870 \times 10^{11}$ m.
- Atomic absorption spectroscopy (AAS)** - See Techniques for Materials Characterization, page 12-1.
- Atomic emission spectroscopy (AES)** - See Techniques for Materials Characterization, page 12-1.
- Atomic force microscopy (AFM)** - See Techniques for Materials Characterization, page 12-1.
- Atomic mass*** - The mass of a nuclide, normally expressed in unified atomic mass units (u).
- Atomic mass unit (u)*** - A unit of mass used in atomic, molecular, and nuclear science, defined as the mass of one atom of ^{12}C divided by 12. Its approximate value is 1.66054×10^{-27} kg. Also called the unified atomic mass unit. [1]
- Atomic number (Z)** - A characteristic property of an element, equal to the number of protons in the nucleus.
- Atomic weight (A_r)*** - The ratio of the average mass per atom of an element to 1/12 of the mass of nuclide ^{12}C . An atomic weight can be defined for a sample of any given isotopic composition. The standard atomic weight refers to a sample of normal terrestrial isotopic composition. The term relative atomic mass is synonymous with atomic weight. [2]
- Attenuated total reflection (ATR)** - See Techniques for Materials Characterization, page 12-1.
- Auger effect** - An atomic process in which an electron from a higher energy level fills a vacancy in an inner shell, transferring the released energy to another electron which is ejected.
- Aurora** - An atmospheric phenomenon in which streamers of light are produced when electrons from the sun are guided into the thermosphere by the earth's magnetic field. It occurs in the polar regions at altitudes of 95–300 km.
- Avogadro constant (N_A)*** - The number of elementary entities in one mole of a substance.
- Azeotrope** - A liquid mixture in a state where the variation of vapor pressure with composition at constant temperature (or, alternatively, the variation of normal boiling point with composition) shows either a maximum or a minimum. Thus when an azeotrope boils the vapor has the same composition as the liquid.
- Azides** - Compounds bearing the group $-N_3$, viz. $-N=N^+=N^-$; usually attached to carbon, e.g. PhN_3 , phenyl azide or azidobenzene. Also used for salts of hydrazoic acid, HN_3 , e.g. NaN_3 , sodium azide. [5]
- Azines** - Condensation products, $R_2C=NN=CR_2$, of two moles of a carbonyl compound with one mole of hydrazine. [5]
- Azo compounds** - Derivatives of diazene (diimide), $HN=NH$, wherein both hydrogens are substituted by hydrocarbyl groups, e.g., $PhN=NPh$, azobenzene or diphenyldiazene. [5]
- Balmer series** - The series of lines in the spectrum of the hydrogen atom which corresponds to transitions between the state with principal quantum number $n = 2$ and successive higher states. The wavelengths are given by $1/\lambda = R_H(1/4 - 1/n^2)$, where $n = 3, 4, \dots$ and R_H is the Rydberg constant for hydrogen. The first member of the series ($n = 2 \rightarrow 3$), which is often called the H_α line, falls at a wavelength of 6563 Å.
- Bar (bar)** - A unit of pressure equal to 10^5 Pa.
- Bardeen-Cooper-Schrieffer (BCS) theory** - A theory of superconductivity which is based upon the formation of electron pairs as a result of an electron-lattice interaction. The theory relates the superconducting transition temperature to the density of states and the Debye temperature.
- Barn (b)** - A unit used for expressing cross sections of nuclear processes, equal to 10^{-28} m².
- Barrel** - A unit of volume equal to 158.9873 L.
- Baryon** - Any elementary particle built up from three quarks. Examples are the proton, neutron, and various short-lived hyperons. Baryons have odd half-integer spins.
- Base** - Historically, a substance that yields an OH^- ion when it dissociates in solution, resulting in a $pH > 7$. In the Brønsted definition, a base is a substance capable of accepting a proton in any type of reaction. The more general definition, due to G.N. Lewis, classifies any chemical species capable of donating an electron pair as a base.
- Becquerel (Bq)*** - The SI unit of radioactivity (disintegrations per unit time), equal to s^{-1} . [1]
- Beer's law** - An approximate expression for the change in intensity of a light beam that passes through an absorbing medium, viz., $\log(I/I_0) = -\epsilon cl$, where I_0 is the incident intensity, I is the final intensity, ϵ is the molar (decadic) absorption coefficient, c is the molar concentration of the absorbing substance, and l is the path length. Also called the Beer-Lambert law
- Binding energy*** - A generic term for the energy required to decompose a system into two or more of its constituent parts. In nuclear physics, the binding energy is the energy difference between a nucleus and the separated nucleons of which it is composed (the energy equivalent of the mass defect). In atomic physics, it is the energy required to remove an electron from an atom.
- Biot (Bi)** - A name sometimes used for the unit of current in the emu system.
- Birefringence** - A property of certain crystals in which two refracted rays result from a single incident light ray. One, the ordinary ray, follows the normal laws of refraction, while the other, the extraordinary ray, exhibits a variable refractive index which depends on the direction in the crystal.
- Black body radiation*** - The radiation emitted by a perfect black body, i.e., a body which absorbs all radiation incident on it and reflects none. The wavelength dependence of the radiated energy density ρ (energy per unit volume per unit wavelength range) is given by the Planck formula
- $$\rho = \frac{8\pi hc}{\lambda^5 \left(e^{hc/\lambda kT} - 1 \right)}$$
- where λ is the wavelength, h is Planck's constant, c is the speed of light, k is the Boltzmann constant, and T is the temperature.
- Black hole** - A very dense object, formed in a supernova explosion, whose gravitational field is so large that no matter or radiation can escape from the object.
- Bloch wave function** - A solution of the Schrödinger equation for an electron moving in a spatially periodic potential; used in the band theory of solids.
- Bohr magneton (μ_B)*** - The atomic unit of magnetic moment, defined as

DEFINITIONS OF SCIENTIFIC TERMS (continued)

- $eh/4\pi m_e$, where h is Planck's constant, m_e the electron mass, and e the elementary charge. It is the moment associated with a single electron spin.
- Bohr, bohr radius (a_0)*** - The radius of the lowest orbit in the Bohr model of the hydrogen atom, defined as $\epsilon_0 h^2 / \pi m_e e^2$, where ϵ_0 is the permittivity of a vacuum, h is Planck's constant, m_e the electron mass, and e the elementary charge. It is customarily taken as the unit of length when using atomic units.
- Boiling point** - The temperature at which the liquid and gas phases of a substance are in equilibrium at a specified pressure. The normal boiling point is the boiling point at normal atmospheric pressure (101.325 kPa).
- Boltzmann constant (k)*** - The molar gas constant R divided by Avogadro's constant.
- Boltzmann distribution** - An expression for the equilibrium distribution of molecules as a function of their energy, in which the number of molecules in a state of energy E is proportional to $\exp(-E/kT)$, where k is the Boltzmann constant and T is the temperature.
- Bond strength** - See Dissociation energy.
- Born-Haber cycle*** - A thermodynamic cycle in which a crystalline solid is converted to gaseous ions and then reconverted to the solid. The cycle permits calculation of the lattice energy of the crystal.
- Bose-Einstein distribution** - A modification of the Boltzmann distribution which applies to a system of particles that are bosons. The number of particles of energy E is proportional to $[e^{(E-\mu)/kT} - 1]^{-1}$, where μ is a normalization constant, k is the Boltzmann constant, and T is the temperature.
- Boson** - A particle that obeys Bose-Einstein Statistics; specifically, any particle with spin equal to zero or an integer. This includes the photon, pion, deuteron, and all nuclei of even mass number.
- Boyle's law** - The empirical law, exact only for an ideal gas, which states that the volume of a gas is inversely proportional to its pressure at constant temperature.
- Bragg angle (θ)** - Defined by the equation $n\lambda = 2d\sin\theta$, which relates the angle θ between a crystal plane and the diffracted x-ray beam, the wavelength λ of the x-rays, the crystal plane spacing d , and the diffraction order n (any integer).
- Bravais lattices*** - The 14 distinct crystal lattices that can exist in three dimensions. They include three in the cubic crystal system, two in the tetragonal, four in the orthorhombic, two in the monoclinic, and one each in the triclinic, hexagonal, and trigonal systems.
- Breakdown voltage** - The potential difference at which an insulating substance undergoes a physical or chemical change that causes it to become a conductor, thus allowing current to flow through the sample.
- Bremsstrahlung** - Electromagnetic radiation generated when the velocity of a charged particle is reduced (literally, "braking radiation"). An example is the x-ray continuum resulting from collisions of electrons with the target in an x-ray tube.
- Brewster angle** - The angle of incidence for which the maximum degree of plane polarization occurs when a beam of unpolarized light is incident on the surface of a medium of refractive index n . At this angle, the angle between the reflected and refracted beams is 90° . The value of the Brewster angle is $\tan^{-1}n$.
- Brillouin scattering** - The scattering of light by acoustic phonons in a solid or liquid.
- Brillouin zone** - A region of allowed wave vectors and energy levels in a crystalline solid, which plays a part in the propagation of waves through the lattice.
- British thermal unit (Btu)** - A non-SI unit of energy, equal to approximately 1055 J. Several values of the Btu, defined in slightly different ways, have been used.
- Brownian motion** - The random movements of small particles suspended in a fluid, which arise from collisions with the fluid molecules.
- Brunauer-Emmett-Teller method (BET)** - See Techniques for Materials Characterization, page 12-1.
- Buffer*** - A solution designed to maintain a constant pH when small amounts of a strong acid or base are added. Buffers usually consist of a fairly weak acid and its salt with a strong base. Suitable concentrations are chosen so that the pH of the solution remains close to the pK_a of the weak acid.
- Calorie (cal)** - A non-SI unit of energy, originally defined as the heat required to raise the temperature of 1 g of water by 1°C . Several calories of slightly different values have been used. The thermochemical calorie is now defined as 4.184 J.
- Candela (cd)*** - The SI base unit of luminous intensity. [1]
- Capacitance (C)** - Ratio of the charge acquired by a body to the change in potential. [1]
- Carbamates** - Salts or esters of carbamic acid, $\text{H}_2\text{NC}(=\text{O})\text{OH}$, or of N-substituted carbamic acids: $\text{R}_2\text{NC}(=\text{O})\text{OR}'$, (R' = hydrocarbyl or a cation). The esters are often called urethanes or urethans, a usage that is strictly correct only for the ethyl esters. [5]
- Carbenes** - The electrically neutral species H_2C : and its derivatives, in which the carbon is covalently bonded to two univalent groups of any kind or a divalent group and bears two nonbonding electrons, which may be spin-paired (singlet state) or spin-non-paired (triplet state). [5]
- Carbinols** - An obsolete term for substituted methanols, in which the name carbinol is synonymous with methanol. [5]
- Carbohydrates** - Originally, compounds such as aldoses and ketoses, having the stoichiometric formula $\text{C}_n(\text{H}_2\text{O})_n$ (hence "hydrates of carbon"). The generic term carbohydrate now includes mono-, oligo-, and polysaccharides, as well as their reaction products and derivatives. [5]
- Carboranes** - A contraction of carbaboranes. Compounds in which a boron atom in a polyboron hydride is replaced by a carbon atom with maintenance of the skeletal structure. [5]
- Carboxylic acids** - Oxoacids having the structure $\text{RC}(=\text{O})\text{OH}$. The term is used as a suffix in systematic name formation to denote the $-\text{C}(=\text{O})\text{OH}$ group including its carbon atom. [5]
- Carnot cycle** - A sequence of reversible changes in a heat engine using a perfect gas as the working substance, which is used to demonstrate that entropy is a state function. The Carnot cycle also provides a means to calculate the efficiency of a heat engine.
- Catalyst** - A substance that participates in a particular chemical reaction and thereby increases its rate but without a net change in the amount of that substance in the system. [3]
- Catenanes, catena compounds** - Hydrocarbons having two or more rings connected in the manner of links of a chain, without a covalent bond. More generally, the class catena compounds embraces functional derivatives and hetero analogues. [5]
- Cation** - A positively charged atomic or molecular particle.
- Centipoise (cP)** - A common non-SI unit of viscosity, equal to mPa s.
- Centrifugal distortion** - An effect in molecular spectroscopy in which rotational levels are lowered in energy, relative to the values of a rigid rotor, as the rotational angular momentum increases. The effect may be understood classically as a stretching of the bonds in the molecule as it rotates faster, thus increasing the moment of inertia.
- Ceramic** - A nonmetallic material of very high melting point.
- Cerenkov radiation** - Light emitted when a beam of charged particles travels through a medium at a speed greater than the speed of light in the medium. It is typically blue in color.
- Cgs system of units** - A system of units based upon the centimeter, gram, and second. The cgs system has been supplanted by the International System (SI).
- Chalcogens** - The Group VIA elements (oxygen, sulfur, selenium, tellurium, and polonium). Compounds of these elements are called chalcogenides. [7]

DEFINITIONS OF SCIENTIFIC TERMS (continued)

- Chaotic system** - A complex system whose behavior is governed by deterministic laws but whose evolution can vary drastically when small changes are made in the initial conditions.
- Charge** - See Electric charge.
- Charles' law** - The empirical law, exact only for an ideal gas, which states that the volume of a gas is directly proportional to its temperature at constant pressure.
- Charm** - A quantum number introduced in particle physics to account for certain properties of elementary particles and their reactions.
- Chelate** - A compound characterized by the presence of bonds from two or more bonding sites within the same ligand to a central metal atom. [3]
- Chemical potential** - For a mixture of substances, the chemical potential of constituent B is defined as the partial derivative of the Gibbs energy G with respect to the amount (number of moles) of B, with temperature, pressure, and amounts of all other constituents held constant. Also called partial molar Gibbs energy. [2]
- Chemical shift*** - A small change in the energy levels (and hence in the spectra associated with these levels) resulting from the effects of chemical binding in a molecule. The term is used in fields such as NMR, Mössbauer, and photoelectron spectroscopy, where the energy levels are determined primarily by nuclear or atomic effects.
- Chiral molecule** - A molecule which cannot be superimposed on its mirror image. A common example is an organic molecule containing a carbon atom to which four different atoms or groups are attached. Such molecules exhibit optical activity, i.e., they rotate the plane of a polarized light beam.
- Chlorocarbons** - Compounds consisting solely of chlorine and carbon. [5]
- Chromatography*** - A method for separation of the components of a sample in which the components are distributed between two phases, one of which is stationary while the other moves. In gas chromatography the gas moves over a liquid or solid stationary phase. In liquid chromatography the liquid mixture moves through another liquid, a solid, or a gel. The mechanism of separation of components may be adsorption, differential solubility, ion-exchange, permeation, or other mechanisms. [6]
- Clapeyron equation** - A relation between pressure and temperature of two phases of a pure substance that are in equilibrium, viz., $dp/dT = \Delta_{\text{trs}}S/\Delta_{\text{trs}}V$, where $\Delta_{\text{trs}}S$ is the difference in entropy between the phases and $\Delta_{\text{trs}}V$ the corresponding difference in volume.
- Clathrates** - Inclusion compounds in which the guest molecule is in a cage formed by the host molecule or by a lattice of host molecules. [5]
- Clausius (Cl)** - A non-SI unit of entropy or heat capacity defined as cal/K = 4.184 J/K. [2]
- Clausius-Clapeyron equation** - An approximation to the Clapeyron equation applicable to liquid-gas and solid-gas equilibrium, in which one assumes an ideal gas with volume much greater than the condensed phase volume. For the liquid-gas case, it takes the form $d(\ln p)/dT = \Delta_{\text{vap}}H/RT^2$, where R is the molar gas constant and $\Delta_{\text{vap}}H$ is the molar enthalpy of vaporization. For the solid-gas case, $\Delta_{\text{vap}}H$ is replaced by the molar enthalpy of sublimation, $\Delta_{\text{sub}}H$.
- Clausius-Mosotti equation** - A relation between the dielectric constant ϵ_r at optical frequencies and the polarizability α :
- $$\frac{\epsilon_r - 1}{\epsilon_r + 2} = \frac{\rho N_A \alpha}{3M\epsilon_0}$$
- where ρ is density, N_A is Avogadro's number, M is molar mass, and ϵ_0 is the permittivity of a vacuum.
- Clebsch-Gordon coefficients** - A set of coefficients used to describe the vector coupling of angular momenta in atomic and nuclear physics.
- Codon** - A set of three bases, chosen from the four primary bases found in the DNA molecule (uracil, cytosine, adenine, and guanine), which specifies the production of a particular amino acid or carries some other genetic instruction. For example, the codon UCA specifies the amino acid serine, CAG specifies glutamine, etc. There are a total of 64 codons.
- Coercive force** - The magnetizing force at which the magnetic flux density is equal to zero. [10]
- Coercivity*** - The maximum value of coercive force that can be attained when a magnetic material is symmetrically magnetized to saturation induction. [10]
- Coherent anti-Stokes Raman spectroscopy (CARS)** - See Techniques for Materials Characterization, page 12-1.
- Colloid** - Molecules or polymolecular particles dispersed in a medium that have, at least in one direction, a dimension roughly between 1 nm and 1 μm . [3]
- Color center** - A defect in a crystal that gives rise to optical absorption, thus changing the color of the material. A common type is the F-center, which results when an electron occupies the site of a negative ion.
- Compressibility (κ)*** - The fractional change of volume as pressure is increased, viz., $\kappa = -(1/V)(dV/dp)$. [1]
- Compton wavelength (λ_C)*** - In the scattering of electromagnetic radiation by a free particle (e.g., electron, proton), $\lambda_C = h/mc$ is the increase in wavelength, at a 90° scattering angle, corresponding to the transfer of energy from radiation to particle. Here h is Planck's constant, c the speed of light, and m the mass of the particle.
- Conductance (G)*** - For direct current, the reciprocal of resistance. More generally, the real part of admittance. [1]
- Conductivity, electrical (σ)*** - The reciprocal of the resistivity. [1]
- Conductivity, thermal** - See Thermal conductivity.
- Congruent transformation** - A phase transition (melting, vaporization, etc.) in which the substance preserves its exact chemical composition.
- Constitutional repeating unit (CRU)** - In polymer science, the smallest constitutional unit, the repetition of which constitutes a regular macromolecule, i.e., a macromolecule with all units connected identically with respect to directional sense. [8]
- Copolymer** - A polymer derived from more than one species of monomer. [8]
- Coriolis effect** - The deviation from simple trajectories when a mechanical system is described in a rotating coordinate system. It affects the motion of projectiles on the earth and in molecular spectroscopy leads to an important interaction between the rotational and vibrational motions. The effect may be described by an additional term in the equations of motion, called the Coriolis force.
- Cosmic rays*** - High energy nuclear particles, electrons, and photons, originating mostly outside the solar system, which continually bombard the earth's atmosphere.
- Coulomb (C)*** - The SI unit of electric charge, equal to A s. [1]
- Coulomb's law** - The statement that the force F between two electrical charges q_1 and q_2 separated by a distance r is $F = (4\pi\epsilon_0)^{-1}q_1q_2/r^2$, where ϵ_0 is the permittivity of a vacuum.
- Covalent bond** - A chemical bond between two atoms whose stability results from the sharing of two electrons, one from each atom.
- Cowling number (Co)** - A dimensionless quantity used in plasma physics, defined by $Co = B^2/\mu\rho v^2$, where ρ is density, v is velocity, μ is permeability, and B is magnetic flux density. [2]
- CPT theorem** - A theorem in particle physics which states that any local Lagrangian theory that is invariant under proper Lorentz transformations is also invariant under the combined operations of charge conjugation, C, space inversion, P, and time reversal, T, taken in any order.
- Critical point*** - In general, the point on the phase diagram of a two-phase system at which the two coexisting phases have identical properties

DEFINITIONS OF SCIENTIFIC TERMS (continued)

- and therefore represent a single phase. At the liquid-gas critical point of a pure substance, the distinction between liquid and gas vanishes, and the vapor pressure curve ends. The coordinates of this point are called the critical temperature and critical pressure. Above the critical temperature, it is not possible to liquefy the substance.
- Cross section (σ)*** - A measure of the probability of collision (or other interaction) between a beam of particles and a target which it encounters. In rough terms it is the effective area the target particles present to the incident ones; however, the precise definition depends on the nature of the interaction. A general definition of σ is the number of encounters per unit time divided by nv , where n is the concentration of incident particles and v their velocity.
- Crosslink** - In polymer science, a small region in a macromolecule from which at least four chains emanate, and formed by reactions involving sites or groups on existing macromolecules or by interactions between existing macromolecules. [8]
- Crown compounds** - Macrocyclic polydentate compounds, usually uncharged, in which three or more coordinating ring atoms (usually oxygen or nitrogen) are or may become suitably close for easy formation of chelate complexes with metal ions or other cationic species. [5]
- Crust*** - The outer layer of the solid earth, above the Mohorovicic discontinuity. Its thickness averages about 35 km on the continents and about 7 km below the ocean floor.
- Cryoscopic constant (E_f)*** - The constant that expresses the amount by which the freezing point T_f of a solvent is lowered by a non-dissociating solute, through the relation $\Delta T_f = E_f m$, where m is the molality of the solute.
- Curie (Ci)** - A non-SI unit of radioactivity (disintegrations per unit time), equal to $3.7 \times 10^{10} \text{ s}^{-1}$.
- Curie temperature (T_C)*** - For a ferromagnetic material, the critical temperature above which the material becomes paramagnetic. Also applied to the temperature at which the spontaneous polarization disappears in a ferroelectric solid. [1]
- Cyanohydrins** - Alcohols substituted by a cyano group, most commonly, but not limited to, examples having a CN and an OH group attached to the same carbon atom. They are formally derived from aldehydes or ketones by the addition of hydrogen cyanide. [5]
- Cycloalkanes** - Saturated monocyclic hydrocarbons (with or without side chains). See alicyclic compounds. Unsaturated monocyclic hydrocarbons having one endocyclic double or one triple bond are called cycloalkenes and cycloalkynes, respectively. [5]
- Cyclotron resonance** - The resonant absorption of energy from a system in which electrons or ions that are orbiting in a uniform magnetic field are subjected to radiofrequency or microwave radiation. The resonance frequency is given by $\nu = eH/2\pi m^*c$, where e is the elementary charge, H is the magnetic field strength, m^* is the effective mass of the charged particle, and c is the speed of light. The effect occurs in both solids (involving electrons or holes) and in low pressure gases (involving ions)
- Dalton (Da)** - A name sometimes used in biochemistry for the unified atomic mass unit (u).
- De Broglie wavelength** - The wavelength associated with the wave representation of a moving particle, given by h/mv , where h is Planck's constant, m the particle mass, and v the velocity.
- De Haas-Van Alphen effect** - An effect observed in certain metals and semiconductors at low temperatures and high magnetic fields, characterized by a periodic variation of magnetic susceptibility with field strength.
- Debye equation*** - The relation between the relative permittivity (dielectric constant) ϵ_r , polarizability α , and permanent dipole moment μ in a dielectric material whose molecules are free to rotate. It takes the form
- $$\frac{\epsilon_r - 1}{\epsilon_r + 2} = \frac{\rho N_A}{3M\epsilon_0} \left(\alpha + \frac{\mu^2}{3kT} \right)$$
- where ρ is density, N_A is Avogadro's number, M is molar mass, and ϵ_0 is the permittivity of a vacuum.
- Debye length** - In the Debye-Hückel theory of ionic solutions, the effective thickness of the cloud of ions of opposite charge which surrounds each given ion and shields the Coulomb potential produced by that ion.
- Debye temperature (θ_D)*** - In the Debye model of the heat capacity of a crystalline solid, $\theta_D = hv_D/k$, where h is Planck's constant, k is the Boltzmann constant, and v_D is the maximum vibrational frequency the crystal can support. For $T \ll \theta_D$, the heat capacity is proportional to T^3 .
- Debye unit (D)** - A non-SI unit of electric dipole moment used in molecular physics, equal to $3.335641 \times 10^{-30} \text{ C m}$.
- Debye-Waller factor (D)** - The factor by which the intensity of a diffraction line is reduced because of lattice vibrations. [1]
- Defect** - Any departure from the regular structure of a crystal lattice. A Frenkel defect results when an atom or ion moves to an interstitial position and leaves behind a vacancy. A Schottky defect involves either a vacancy where the atom has moved to the surface or a structure where a surface atom has moved to an interstitial position.
- Degree of polymerization** - The number of monomeric units in a macromolecule or an oligomer molecule. [8]
- Dendrite** - A tree-like crystalline pattern often observed, for example, in ice crystals and alloys in which the crystal growth branches repeatedly.
- Density (ρ)*** - In the most common usage, mass density or mass per unit volume. More generally, the amount of some quantity (mass, charge, energy, etc.) divided by a length, area, or volume.
- Density of states (N_E, ρ)** - The number of one-electron states in an infinitesimal interval of energy, divided by the range of that interval and by volume. [1]
- Dew point*** - The temperature at which liquid begins to condense as the temperature of a gas mixture is lowered. In meteorology, it is the temperature at which moisture begins to condense on a surface in contact with the air.
- Diamagnetism** - A type of magnetism characterized by a negative magnetic susceptibility, so that the material, when placed in an external magnetic field, becomes weakly magnetized in the direction opposite to the field. This magnetization is independent of temperature.
- Diazo compounds** - Compounds having the divalent diazo group, $=N^+=N^+$, attached to a carbon atom, e.g., $\text{CH}_2=\text{N}_2$ diazomethane. [5]
- Dielectric constant (ϵ)*** - Ratio of the electric displacement in a medium to the electric field strength. Also called permittivity. [1]
- Dienes** - Compounds that contain two fixed double bonds (usually assumed to be between carbon atoms). Dienes in which the two double-bond units are linked by one single bond are termed conjugated. [5]
- Differential scanning calorimetry (DSC)** - See Techniques for Materials Characterization, page 12-1.
- Differential thermal analysis (DTA)** - See Techniques for Materials Characterization, page 12-1.
- Diffusion*** - The migration of atoms, molecules, ions, or other particles as a result of some type of gradient (concentration, temperature, etc.).
- Dioptr** - A unit used in optics, formally equal to m^{-1} . It is used in expressing dioptric power, which is the reciprocal of the focal length of a lens.
- Dipole moment, electric (p, μ)*** - For a distribution of equal positive and

DEFINITIONS OF SCIENTIFIC TERMS (continued)

- negative charge, the magnitude of the dipole moment vector is the positive charge multiplied by the distance between the centers of positive and negative charge distribution. The direction is given by the line from the center of negative charge to the center of positive charge.
- Dipole moment, magnetic (m, μ)** - Formally defined in electromagnetic theory as a vector quantity whose vector product with the magnetic flux density equals the torque. The magnetic dipole generated by a current I flowing in a small loop of area A has a magnetic moment of magnitude IA . In atomic and nuclear physics, a magnetic moment is associated with the angular momentum of a particle; e.g., an electron with orbital angular momentum l exhibits a magnetic moment of $-e\hbar/2m_e$ where e is the elementary charge and m_e the mass of the electron. [1]
- Disaccharides** - Compounds in which two monosaccharides are joined by a glycosidic bond. [5]
- Dislocation** - An extended displacement of a crystal from a regular lattice. An edge dislocation results when one portion of the crystal has partially slipped with respect to the other, resulting in an extra plane of atoms extending through part of the crystal. A screw dislocation transforms successive atomic planes into the surface of a helix.
- Dispersion** - Splitting of a beam of light (or other electromagnetic radiation) of mixed wavelengths into the constituent wavelengths as a result of the variation of refractive index of the medium with wavelength.
- Dissociation constant*** - The equilibrium constant for a chemical reaction in which a compound dissociates into its constituent parts.
- Dissociation energy (D_0)*** - For a diatomic molecule, the difference between the energies of the free atoms at rest and the minimum in the potential energy curve. The term bond dissociation energy (D_0), which can be applied to polyatomic molecules as well, is used for the difference between the energies of the fragments resulting when a bond is broken and the energy of the original molecule in its lowest energy state. The term bond strength implies differences in enthalpy rather than energy.
- Domain** - A small region of a solid in which the magnetic or electric moments of the individual units (atoms, molecules, or ions) are aligned in the same direction.
- Domain wall** - The transition region between adjacent ferromagnetic domains, generally a layer with a thickness of a few hundred ångström units. Also called Bloch wall.
- Doppler effect** - The change in the apparent frequency of a wave (sound, light, or other) when the source of the wave is moving relative to the observer.
- Dose equivalent (H)** - The product of the absorbed dose of radiation at a point of interest in tissue and various modifying factors which depend on the type of tissue and radiation. [1]
- Drift velocity** - The velocity of charge carriers (electrons, ions, etc.) moving under the influence of an electric field in a medium which subjects the carriers to some frictional force.
- Dyne (dyn)** - A non-SI (cgs) unit of force, equal to 10^{-5} N.
- Ebullioscopic constant (E_b)*** - The constant that expresses the amount by which the boiling point T_b of a solvent is raised by a non-dissociating solute, through the relation $\Delta T_b = E_b m$, where m is the molality of the solute.
- Eddy currents** - Circulating currents set up in conducting bulk materials or sheets by varying magnetic fields.
- Effinghausen effect** - The appearance of a temperature gradient in a current carrying conductor that is placed in a transverse magnetic field. The direction of the gradient is perpendicular to the current and the field.
- Eigenvalue** - An allowed value of the constant a in the equation $Au = au$, where A is an operator acting on a function u (which is called an eigenfunction). In quantum mechanics, the outcome of any observation is an eigenvalue of the corresponding operator. Also called characteristic value.
- Einstein** - A non-SI unit used in photochemistry, equal to one mole of photons.
- Einstein temperature (θ_v)** - In the Einstein theory of the heat capacity of a crystalline solid, $\theta_v = h\nu/k$, where h is Planck's constant, k is the Boltzmann constant, and ν is the vibrational frequency of the crystal.
- Einstein transition probability** - A constant in the Einstein relation $A_{ij} + B_{ij}\rho$ for the probability of a transition between two energy levels i and j in a radiation field of energy density ρ . The A_{ij} coefficient describes the probability of spontaneous emission, while B_{ij} and B_{ji} govern the probability of stimulated emission and absorption, respectively ($B_{ij} = B_{ji}$).
- Elastic limit** - The greatest stress which a material is capable of sustaining without any permanent strain remaining after complete release of the stress. [10]
- Elastic modulus** - See Young's modulus.
- Electric charge (Q)** - The quantity of electricity; i.e., the property that controls interactions between bodies through electrical forces.
- Electric current (I)** - The charge passing through a circuit per unit time. [1]
- Electric displacement (D)** - A vector quantity whose magnitude equals the electric field strength multiplied by the permittivity of the medium and whose direction is the same as that of the field strength.
- Electric field strength (E)** - The force exerted by an electric field on a point charge divided by the electric charge. [1]
- Electric potential (V)** - A scalar quantity whose gradient is equal to the negative of the electric field strength.
- Electrical conductance** - See Conductance
- Electrical resistance** - See Resistance
- Electrical resistivity** - See Resistivity.
- Electrochemical series*** - An arrangement of reactions which produce or consume electrons in an order based on standard electrode potentials. A common arrangement places metals in decreasing order of their tendency to give up electrons.
- Electrode potential*** - The electromotive force of a cell in which the electrode on the left is the standard hydrogen electrode and that on the right is the electrode in question. [2]
- Electrolysis** - The decomposition of a substance as a result of passing an electric current between two electrodes immersed in the sample.
- Electromotive force (emf)** - The energy supplied by a source divided by the charge transported through the source. [1]
- Electron*** - An elementary particle in the family of leptons, with negative charge and spin of $1/2$.
- Electron affinity*** - The energy difference between the ground state of a gas-phase atom or molecule and the lowest state of the corresponding negative ion.
- Electron cyclotron resonance (ECR)** - See Techniques for Materials Characterization, page 12-1.
- Electron energy loss spectroscopy (EELS)** - See Techniques for Materials Characterization, page 12-1.
- Electron nuclear double resonance (ENDOR)** - See Techniques for Materials Characterization, page 12-1.
- Electron paramagnetic resonance (EPR)** - See Techniques for Materials Characterization, page 12-1.
- Electron probe microanalysis (EPMA)** - See Techniques for Materials Characterization, page 12-1.
- Electron spectroscopy for chemical analysis (ESCA)** - See Techniques for Materials Characterization, page 12-1.
- Electron spin (s)** - The quantum number, equal to $1/2$, that specifies the intrinsic angular momentum of the electron.

DEFINITIONS OF SCIENTIFIC TERMS (continued)

Electron stimulated desorption (ESD) - See Techniques for Materials Characterization, page 12-1.

Electron volt (eV)* - A non-SI unit of energy used in atomic and nuclear physics, equal to approximately 1.602177×10^{-19} J. The electron volt is defined as the kinetic energy acquired by an electron upon acceleration through a potential difference of 1 V. [1]

Electronegativity* - A parameter originally introduced by Pauling which describes, on a relative basis, the power of an atom or group of atoms to attract electrons from the same molecular entity. [3]

Electrophoresis - The motion of macromolecules or colloidal particles in an electric field. [3]

Emissivity (ϵ)* - Ratio of the radiant flux emitted per unit area to that of an ideal black body at the same temperature. Also called emittance. [1]

Emu - The electromagnetic system of units, based upon the cm, g, and s plus the emu of current (sometimes called the abampere).

Enantiomers - A chiral molecule and its non-superposable mirror image. The two forms rotate the plane of polarized light by equal amounts in opposite directions. Also called optical isomers.

Energy (E, U)* - The characteristic of a system that enables it to do work.

Energy gap* - In the theory of solids, the region between two energy bands, in which no bound states can occur.

Enols, alkenols - The term refers specifically to vinylic alcohols, which have the structure $\text{HOOCR}'=\text{CR}_2$. Enols are tautomeric with aldehydes ($\text{R}' = \text{H}$) or ketones (R' not equal to H). [5]

Enthalpy (H)* - A thermodynamic function, especially useful when dealing with constant-pressure processes, defined by $H = E + PV$, where E is energy, P pressure, and V volume. [1]

Enthalpy of combustion* - The enthalpy change in a combustion reaction. Its negative is the heat released in combustion.

Enthalpy of formation, standard* - The enthalpy change for the reaction in which a substance is formed from its constituent elements, each in its standard reference state (normally refers to 1 mol, sometimes to 1 g, of the substance).

Enthalpy of fusion* - The enthalpy change in the transition from solid to liquid state.

Enthalpy of sublimation - The enthalpy change in the transition from solid to gas state.

Enthalpy of vaporization* - The enthalpy change in the transition from liquid to gas state.

Entropy (S)* - A thermodynamic function defined such that when a small quantity of heat dQ is received by a system at temperature T , the entropy of the system is increased by dQ/T , provided that no irreversible change takes place in the system. [1]

Entropy unit (e.u.) - A non-SI unit of entropy, equal to 4.184 J/K mol.

Ephemeris time - Time measured in tropical years from January 1, 1900.

Epoxy compounds - Compounds in which an oxygen atom is directly attached to two adjacent or non-adjacent carbon atoms of a carbon chain or ring system; thus cyclic ethers. [5]

Equation of continuity - Any of a class of equations that express the fact that some quantity (mass, charge, energy, etc.) cannot be created or destroyed. Such equations typically specify that the rate of increase of the quantity in a given region of space equals the net current of the quantity flowing into the region.

Equation of state* - An equation relating the pressure, volume, and temperature of a substance or system.

Equilibrium constant (K)* - For a chemical reaction $aA + bB \rightleftharpoons cC + dD$, the equilibrium constant is defined by:

$$K = \frac{a_C^c \cdot a_D^d}{a_A^a \cdot a_B^b}$$

where a_i is the activity of component i . To a certain approximation, the activities can be replaced by concentrations. The equilibrium constant

is related to $\Delta_r G^\circ$, the standard Gibbs energy change in the reaction, by $RT \ln K = -\Delta_r G^\circ$.

Equivalent conductance - See Conductivity, electrical

Erg (erg) - A non-SI (cgs) unit of energy, equal to 10^{-7} J.

Esters - Compounds formally derived from an oxoacid $\text{RC}(=\text{O})(\text{OH})$ and an alcohol, phenol, heteroarenol, or enol by linking, with formal loss of water from an acidic hydroxy group of the former and a hydroxy group of the latter. [5]

esu - The electrostatic system of units, based upon the cm, g, and s plus the esu of charge (sometimes called the statcoulomb or franklin).

Ethers - Compounds with formula ROR , where R is not equal to H. [5]

Euler number (Eu) - A dimensionless quantity used in fluid mechanics, defined by $Eu = \Delta p / \rho v^2$, where p is pressure, ρ is density, and v is velocity. [2]

Eutectic - The point on a two-component solid-liquid phase diagram which represents the lowest melting point of any possible mixture. A liquid having the eutectic composition will freeze at a single temperature without change of composition.

Excitance (M) - Radiant energy flux leaving an element of a surface divided by the area of that element. [1]

Exciton - A localized excited state consisting of a bound electron-hole pair in a molecular or ionic crystal. The exciton can propagate through the crystal.

Exosphere - The outermost part of the earth's atmosphere, beginning at about 500 to 1000 km above the surface. It is characterized by densities so low that air molecules can escape into outer space.

Expansion coefficient - See thermal expansion coefficient.

Extended electron energy loss fine structure (EXELFS) - See Techniques for Materials Characterization, page 12-1.

Extended x-ray absorption fine structure (EXAFS) - See Techniques for Materials Characterization, page 12-1.

Extinction coefficient - See Absorption coefficient, molar

F-Center - See Color center

Fahrenheit temperature ($^\circ\text{F}$) - The temperature scale based on the assignment of $32^\circ\text{F} = 0^\circ\text{C}$ and a temperature interval of $^\circ\text{F} = (5/9)^\circ\text{C}$; i.e., $t/^\circ\text{F} = (9/5)t/^\circ\text{C} + 32$.

Farad (F)* - The SI unit of electric capacitance, equal to C/V. [1]

Faraday constant (F)* - The electric charge of 1 mol of singly charged positive ions; i.e., $F = N_A e$, where N_A is Avogadro's constant and e is the elementary charge. [1]

Faraday effect* - The rotation of the plane of plane-polarized light by a medium placed in a magnetic field parallel to the direction of the light beam. The effect can be observed in solids, liquids, and gasses.

Fatty acids - Aliphatic monocarboxylic acids derived from or contained in esterified form in an animal or vegetable fat, oil, or wax. Natural fatty acids commonly have a chain of 4 to 28 carbons (usually unbranched and even-numbered), which may be saturated or unsaturated. By extension, the term is sometimes used to embrace all acyclic aliphatic carboxylic acids. [5]

Fermat's principle - The law that a ray of light traversing one or more media will follow a path which minimizes the time required to pass between two given points.

Fermi (f) - Name sometimes used in nuclear physics for the femtometer.

Fermi level - The highest energy of occupied states in a solid at zero temperature. Sometimes called Fermi energy. The Fermi surface is the surface in momentum space formed by electrons occupying the Fermi level.

Fermi resonance - An effect observed in vibrational spectroscopy when an overtone of one fundamental vibration closely coincides in energy with another fundamental of the same symmetry species. It leads to a splitting of vibrational bands.

Fermi-Dirac distribution - A modification of the Boltzmann distribu-

DEFINITIONS OF SCIENTIFIC TERMS (continued)

- tion which takes into account the Pauli exclusion principle. The number of particles of energy E is proportional to $[e^{(E-\mu)/kT} + 1]^{-1}$, where μ is a normalization constant, k the Boltzmann constant, and T the temperature. The distribution is applicable to a system of fermions.
- Fermion** - A particle that obeys Fermi-Dirac statistics. Specifically, any particle with spin equal to an odd multiple of $1/2$. Examples are the electron, proton, neutron, muon, etc.
- Ferrimagnetism*** - A type of magnetism in which the magnetic moments of atoms in a solid are ordered into two nonequivalent sublattices with unequal magnetic moments, leading to a nonzero magnetic susceptibility.
- Ferrite** - A ferrimagnetic material of nominal formula MFe_2O_4 , where M is a divalent metal; widely used in microwave switches and other solid state devices.
- Ferroelectricity*** - The retention of electric polarization by certain materials after the external field that produced the polarization has been removed.
- Ferromagnetism*** - A type of magnetism in which the magnetic moments of atoms in a solid are aligned within domains which can in turn be aligned with each other by a weak magnetic field. Some ferromagnetic materials can retain their magnetization when the external field is removed, as long as the temperature is below a critical value, the Curie temperature. They are characterized by a large positive magnetic susceptibility.
- Fick's law** - The statement that the flux J of a diffusing substance is proportional to the concentration gradient, i.e., $J = -D(dc/dx)$, where D is called the diffusion coefficient.
- Field** - A mathematical construct which describes the interaction between particles resulting from gravity, electromagnetism, or other physical phenomena. In classical physics a field is described by equations. Quantum field theory introduces operators to represent the physical observables.
- Field emission microscopy (FEM)** - See Techniques for Materials Characterization, page 12-1.
- Field ion microscopy (FIM)** - See Techniques for Materials Characterization, page 12-1.
- Fine structure** - The splitting in spectral lines that results from interactions of the electron spin with the orbital angular momentum.
- Fine structure constant (α)*** - Defined as $e^2/2hc\epsilon_0$, where e is the elementary charge, h Planck's constant, c the speed of light, and ϵ_0 the permittivity of a vacuum. It is a measure of the strength of the electromagnetic interaction between particles.
- First radiation constant (e_1)*** - Constant ($= 2\pi hc^2$) in the equation for the radiant exitance M_λ of a black body:
- $$M_\lambda = \frac{c_1 \lambda^{-5} \Delta\lambda}{e^{c_2/\lambda T} - 1}$$
- where λ is the wavelength, T is the temperature, and $c_2 = hc/k$ is the second radiation constant.
- Flash point** - The lowest temperature at which vapors above a volatile combustible substance will ignite in air when exposed to a flame. [10]
- Fluence (F)** - Term used in photochemistry to specify the energy per unit area delivered in a given time interval, for example by a laser pulse. [2]
- Fluorocarbons** - Compounds consisting solely of fluorine and carbon. [5]
- Fluxoid** - The quantum of magnetic flux in superconductivity theory, equal to $hc/2e$, where h is Planck's constant, c the velocity of light, and e the elementary charge.
- Force (F)** - The rate of change of momentum with time. [1]
- Force constants (f, k)*** - In molecular vibrations, the coefficients in the expression of the potential energy in terms of atom displacements from their equilibrium positions. In a diatomic molecule, $f = d^2V/dr^2$, where $V(r)$ is the potential energy and r is the interatomic distance. [2]
- Fourier number (Fo)** - A dimensionless quantity used in fluid mechanics, defined by $Fo = at/l^2$, where a is thermal diffusivity, t is time, and l is length. [2]
- Fourier transform infrared spectroscopy (FTIR)** - A technique for obtaining an infrared spectrum by use of an interferometer in which the path length of one of the beams is varied. A Fourier transformation of the resulting interferogram yields the actual spectrum. The technique is also used for NMR and other types of spectroscopy.
- Fractals** - Geometrical objects that are self-similar under a change of scale; i.e., they appear similar at all levels of magnification. They can be considered to have fractional dimensionality. Examples occur in diverse fields such as geography (rivers and shorelines), biology (trees), and solid state physics (amorphous materials).
- Franck-Condon principle** - An important principle in molecular spectroscopy which states that the nuclei in a molecule remain essentially stationary while an electronic transition is taking place. The physical interpretation rests on the fact that the electrons move much more rapidly than the nuclei because of their much smaller mass.
- Franklin (Fr)** - Name sometimes given to the unit of charge in the esu system.
- Fraunhofer diffraction** - Diffraction of light in situations where the source and observation point are so far removed that the wave surfaces may be considered planar.
- Fraunhofer lines** - Sharp absorption lines in the spectrum of sunlight, caused by absorption of the solar blackbody radiation by atoms near the sun's surface.
- Free radical** - See Radicals. The term "free radical" is often used more broadly for molecules that have a paramagnetic ground state (e.g., O_2) and sometimes for any transient or highly reactive molecular species.
- Freezing point** - See Melting point
- Frequency (ν)*** - Number of cycles of a periodic phenomenon divided by time. [1]
- Fresnel diffraction** - Diffraction of light in a situation where the source and observation point are sufficiently close together that the curvature of the wave surfaces must be taken into account.
- Froude number (Fr)** - A dimensionless quantity used in fluid mechanics, defined by $Fr = v/(lg)^{1/2}$, where v is velocity, l is length, and g is acceleration due to gravity. [2]
- Fugacity (f_B)** - For a gas mixture, the fugacity of component B is defined as the absolute activity λ_B times the limit, as the pressure p approaches zero at constant temperature, of p_B/λ_B . [2]
- Fullerenes** - Compounds composed solely of an even number of carbon atoms, which form a cage-like fused-ring polycyclic system with twelve five-membered rings and the rest six-membered rings. The archetypal example is [60]fullerene, where the atoms and bonds delineate a truncated icosahedron. The term has been broadened to include any closed cage structure consisting entirely of three-coordinate carbon atoms. [5]
- Fulvalenes** - The hydrocarbon fulvalene and its derivatives formed by substitution (and by extension, analogues formed by replacement of one or more carbon atoms of the fulvalene skeleton by a heteroatom). [5]
- Fulvenes** - The hydrocarbon fulvene and its derivatives formed by substitution (and by extension, analogues formed by replacement of one or more carbon atoms of the fulvene skeleton by a heteroatom). [5]
- Fundamental vibrational frequencies*** - In molecular spectroscopy, the characteristic vibrational frequencies obtained when the vibrational energy is expressed in normal coordinates. They determine the primary features of the infrared and Raman spectra of the molecule.
- γ - Name sometimes used for microgram.
- γ -rays*** - Electromagnetic radiation (photons) with energy greater than about 0.1 MeV (wavelength less than about 1 pm).
- g -Factor of the electron*** - The proportionality factor in the equation

DEFINITIONS OF SCIENTIFIC TERMS (continued)

- relating the magnetic moment μ of an electron to its total angular momentum quantum number J , i.e., $\mu = -g\mu_B J$, where μ_B is the Bohr magneton. Also called Landé factor.
- Gal** - A non-SI unit of acceleration, equal to 0.01 m/s. Also called galileo.
- Gallon (US)** - A unit of volume equal to 3.785412 L.
- Gallon (UK, Imperial)** - A unit of volume equal to 4.546090 L.
- Gauss (G)** - A non-SI unit of magnetic flux density (B) equal to 10^{-4} T.
- Gaussian system of units** - A hybrid system used in electromagnetic theory, which combines features of both the esu and emu systems.
- Gel** - A colloidal system with a finite, but usually rather small, yield stress (the shear stress at which yielding starts abruptly). [3]
- Genetic code*** - The set of relations between each of the 64 codons of DNA and a specific amino acid (or other genetic instruction).
- Gibbs energy (G)*** - An important function in chemical thermodynamics, defined by $G = H - TS$, where H is the enthalpy, S the entropy, and T the thermodynamic temperature. Sometimes called Gibbs free energy and, in older literature, simply "free energy". [2]
- Gibbs phase rule** - The relation $F = C - P + 2$, where C is the number of components in a mixture, P is the number of phases, and F is the degrees of freedom, i.e., the number of intensive variables that can be changed independently without affecting the number of phases.
- Glass transition temperature*** - The temperature at which an amorphous polymer is transformed, in a reversible way, from a viscous or rubbery condition to a hard and relatively brittle one. [10]
- Glow discharge mass spectroscopy (GDMS)** - See Techniques for Materials Characterization, page 12-1.
- Gluon** - A hypothetical particle postulated to take part in the binding of quarks, in analogy to the role of the photon in electromagnetic interactions.
- Glycerides** - Esters of glycerol (propane-1,2,3-triol) with fatty acids, widely distributed in nature. They are by long-established custom subdivided into triglycerides, 1,2- or 1,3-diglycerides, and 1- or 2-monoglycerides, according to the number and positions of acyl groups. [5]
- Glycols** - Dihydric alcohols in which two hydroxy groups are on different carbon atoms, usually but not necessarily adjacent. Also called diols. [5]
- Grain (gr)** - A non-SI unit of mass, equal to 64.79891 mg.
- Grain boundary** - The interface between two regions of different crystal orientation.
- Grashof number (Gr)** - A dimensionless quantity used in fluid mechanics, defined by $Gr = \beta g \alpha \Delta T p^2 / \eta^2$, where T is temperature, p is density, l is length, η is viscosity, α is cubic expansion coefficient, and g is acceleration of gravity. [2]
- Gravitational constant (G)*** - The universal constant in the equation for the gravitational force between two particles, $F = Gm_1m_2/r^2$, where r is the distance between the particles and m_1 and m_2 are their masses. [1]
- Gray (Gy)*** - The SI unit of absorbed dose of radiation, equal to J/kg. [1]
- Gregorian calendar** - The modification of the Julian calendar introduced in 1582 by Pope Gregory XII which specified that a year divisible by 100 is a leap year only if divisible by 400.
- Grignard reagents** - Organomagnesium halides, RMgX , having a carbon-magnesium bond (or their equilibrium mixtures in solution with $\text{R}_2\text{Mg} + \text{MgX}_2$). [5]
- Grüneisen parameter (γ)** - Defined by $\gamma = \alpha_V / \kappa c_V \rho$, where α_V is the cubic thermal expansion coefficient, κ is the isothermal compressibility, c_V is the specific heat capacity at constant volume, and ρ is the mass density. γ is independent of temperature for most crystalline solids. [1]
- Gyromagnetic ratio (γ)** - Ratio of the magnetic moment of a particle to its angular momentum. Also called magnetogyric ratio.
- Hadron** - Any elementary particle that can take part in the strong interaction. Hadrons are subdivided into baryons, with odd half integer spins, and mesons, which have zero or integral spin.
- Hall effect*** - The development of a transverse potential difference V in a conducting material when subjected to a magnetic field H perpendicular to the direction of the current. The potential difference is given by $V = R_H B J t$, where B is the magnetic induction, J the current density, t the thickness of the specimen in the direction of the potential difference, and R_H is called the Hall coefficient.
- Halocarbon** - A compound containing no elements other than carbon, hydrogen, and one or more halogens. In common practice, the term is used mainly for compounds of no more than four or five carbon atoms.
- Halogens** - The elements F, Cl, Br, I, and At. Compounds of these elements are called halogenides or halides. [7]
- Hamiltonian (H)** - An expression for the total energy of a mechanical system in terms of the momenta and positions of constituent particles. In quantum mechanics, the Hamiltonian operator appears in the eigenvalue equation $H\psi = E\psi$, where E is an energy eigenvalue and ψ the corresponding eigenfunction.
- Hardness*** - The resistance of a material to deformation, indentation, or scratching. Hardness is measured on various scales, such as Mohs, Brinell, Knoop, Rockwell, and Vickers. [10]
- Hartmann number (Ha)** - A dimensionless quantity used in plasma physics, defined by $Ha = Bl(\kappa/\eta)^{1/2}$, where B is magnetic flux density, l is length, κ is electric conductivity, and η is viscosity. [2]
- Hartree (E_h)*** - An energy unit used in atomic and molecular science, equal to approximately $4.3597482 \times 10^{-18}$ J.
- Hartree-Fock method** - A iterative procedure for solving the Schrödinger equation for an atom or molecule in which the equation is solved for each electron in an initial assumed potential from all the other electrons. The new potential that results is used to repeat the calculation and the procedure continued until convergence is reached. Also called self-consistent field (SCF) method.
- Heat capacity*** - Defined in general as dQ/dT , where dQ is the amount of heat that must be added to a system to increase its temperature by a small amount dT . The heat capacity at constant pressure is $C_p = (\partial H / \partial T)_p$; that at constant volume is $C_V = (\partial E / \partial T)_V$, where H is enthalpy, E is internal energy, p is pressure, V is volume, and T is temperature. An upper case C normally indicates the molar heat capacity, while a lower case c is used for the specific (per unit mass) heat capacity. [1]
- Heat of formation, vaporization, etc.** - See corresponding terms under Enthalpy.
- Hectare (ha)** - A unit of area equal to 10^4 m². [1]
- Heisenberg uncertainty principle** - The statement that two observable properties of a system that are complementary, in the sense that their quantum-mechanical operators do not commute, cannot be specified simultaneously with absolute precision. An example is the position and momentum of a particle; according to this principle, the uncertainties in position Δq and momentum Δp must satisfy the relation $\Delta p \Delta q \geq h/4\pi$, where h is Planck's constant.
- Heitler-London model** - An early quantum-mechanical model of the hydrogen atom which introduced the concept of the exchange interaction between electrons as the primary reason for stability of the chemical bond.
- Helicon** - A low-frequency wave generated when a metal at low temperature is exposed to a uniform magnetic field and a circularly polarized electric field.
- Helmholtz energy (A)** - A thermodynamic function defined by $A = E - TS$, where E is the energy, S the entropy, and T the thermodynamic temperature. [2]
- Hemiacetals** - Compounds having the general formula $\text{R}_2\text{C}(\text{OH})\text{OR}'$ (R' not equal to H). [5]
- Henry (H)*** - The SI unit of inductance, equal to Wb/A . [1]

DEFINITIONS OF SCIENTIFIC TERMS (continued)

- Henry's law *** - An expression which applies to an ideal dilute solution in which one or more gasses are dissolved, viz., $p_i = H_i x_i$, where p_i is the partial pressure of component i above the solution, x_i is its mole fraction in the solution, and H_i is the Henry's law constant (a characteristic of the given gas and solvent, as well as the temperature).
- Hermitian operator** - An operator A that satisfies the relation $\int u_m^* A u_n dx = (\int u_n^* A u_m dx)^*$, where $*$ indicates the complex conjugate. The eigenvalues of Hermitian operators are real, and eigenfunctions belonging to different eigenvalues are orthogonal.
- Hertz (Hz)** - The SI unit of frequency, equal to s^{-1} . [1]
- Heterocyclic compounds** - Cyclic compounds having as ring members atoms of at least two different elements, e.g., quinoline, 1,2-thiazole, bicyclo[3.3.1]tetrasiloxane. [5]
- Heusler alloys** - Alloys of manganese, copper, aluminum, nickel, and sometimes other metals which find important uses as permanent magnets.
- Holography** - A technique for creating a three-dimensional image of a object by recording the interference pattern between a light beam diffracted from the object and a reference beam. The image can be reconstructed from this pattern by a suitable optical system.
- Homopolymer** - A polymer derived from one species of (real, implicit, or hypothetical) monomer. [8]
- Hooke's law** - The statement that the ratio of stress to strain is a constant in a totally elastic medium.
- Horse power** - A non-SI unit of energy, equal to approximately 746 W.
- Hubble constant** - The ratio of the recessional velocity of an extragalactic object to the distance of that object. Its value is about $2 \times 10^{-18} s^{-1}$.
- Huckel theory** - A simple approximation for calculating the energy of conjugated molecules in which only the resonance integrals between neighboring bonds are considered. Also called CNDO method (complete neglect of differential overlap).
- Hume-Rothery rules** - A set of empirical rules for predicting the occurrence of solid solutions in metallic systems. The rules involve size, crystal structure, and electronegativity.
- Hund's rules** - A series of rules for predicting the sequence of energy states in atoms and molecules. One of the important results is that when two electrons exist in different orbitals, the state with their spins parallel (triplet state) lies at lower energy than the state with antiparallel spins (singlet).
- Hydrazines** - Hydrazine (diazane), H_2NNH_2 , and its hydrocarbyl derivatives. When one or more substituents are acyl groups, the compound is a hydrazide. [5]
- Hydrocarbon** - A compound containing only carbon and hydrogen. [5]
- Hydrolysis** - A reaction occurring in water in which a chemical bond is cleaved and a new bond formed with the oxygen atom of water.
- Hyperfine structure** - Splitting of energy levels and spectral lines into several closely spaced components as a result of interaction of nuclear spin angular momentum with other angular momenta in the atom or molecule.
- Hysteresis*** - An irreversible response of a system (parameter A) as a function of an external force (parameter F), usually symmetric with respect to the origin of the A vs. F graph after the initial application of the force. A common example is magnetic induction vs. magnetic field strength in a ferromagnet.
- Ideal gas law** - The equation of state $pV = RT$, which defines an ideal gas, where p is pressure, V molar volume, T temperature, and R the molar gas constant.
- Ideal solution** - A solution in which solvent-solvent and solvent-solute interactions are identical, so that properties such as volume and enthalpy are exactly additive. Ideal solutions follow Raoult's law, which states that the vapor pressure p_i of component i is $p_i = x_i p_i^*$, where x_i is the mole fraction of component i and p_i^* the vapor pressure of the pure substance i .
- Ignition temperature*** - The lowest temperature at which combustion of a material will occur spontaneously under specified conditions. Sometimes called autoignition temperature, kindling point. [10]
- Imides** - Diacyl derivatives of ammonia or primary amines, especially those cyclic compounds derived from diacids. Also used for salts having the anion RN_2^- . [5]
- Impedance (Z)** - The complex representation of potential difference divided by the complex representation of current. In terms of reactance X and resistance R , the impedance is given by $Z = R + iX$. [1]
- Index of refraction (n)*** - For a non-absorbing medium, the ratio of the velocity of electromagnetic radiation *in vacuo* to the phase velocity of radiation of a specified frequency in the medium. [1]
- Inductance** - The ratio of the electromagnetic force induced in a coil by a current to the rate of change of the current.
- Inductive coupled plasma mass spectroscopy (ICPMS)** - See Techniques for Materials Characterization, page 12-1.
- Inertial defect** - In molecular spectroscopy, the quantity $I_c - I_a - I_b$ for a molecule whose equilibrium configuration is planar, where I_a , I_b , and I_c are the effective principal moments of inertia. The inertial defect for a rigid planar molecule would be zero, but vibration-rotation interactions in a real molecule lead to a positive inertial defect.
- Insulator** - A material in which the highest occupied energy band (valence band) is completely filled with electrons, while the next higher band (conduction band) is empty. Solids with an energy gap of 5 eV or more are generally considered as insulators at room temperature. Their conductivity is less than $10^{-6} S/m$ and increases with temperature.
- Intercalation compounds** - Compounds resulting from reversible inclusion, without covalent bonding, of one kind of molecule in a solid matrix of another compound, which has a laminar structure. The host compound, a solid, may be macromolecular, crystalline, or amorphous. [5]
- International System of Units (SI)*** - The unit system adopted by the General Conference on Weights and Measures in 1960. It consists of seven base units (meter, kilogram, second, ampere, kelvin, mole, candela), plus derived units and prefixes. [1]
- International Temperature Scale (ITS-90)*** - The official international temperature scale adopted in 1990. It consists of a set of fixed points and equations which enable the thermodynamic temperature to be determined from operational measurements. [9]
- Ion** - An atomic or molecular particle having a net electric charge. [3]
- Ion exchange** - A process involving the adsorption of one or several ionic species accompanied by the simultaneous desorption (displacement) of one or more other ionic species. [3]
- Ion neutralization spectroscopy (INS)** - See Techniques for Materials Characterization, page 12-1.
- Ionic strength (I)** - A measure of the total concentration of ions in a solution, defined by $I = 1/2 \sum_i z_i^2 m_i$, where z_i is the charge of ionic species i and m_i is its molality. For a 1-1 electrolyte at molality m , $I = m$.
- Ionization constant*** - The equilibrium constant for a reaction in which a substance in solution dissociates into ions.
- Ionization potential*** - The minimum energy required to remove an electron from an isolated atom or molecule (in its vibrational ground state) in the gaseous phase. More properly called ionization energy. [3]
- Irradiance (E)** - The radiant energy flux incident on an element of a surface, divided by the area of that element. [1]
- Isentropic process** - A thermodynamic process in which the entropy of the system does not change.
- Ising model** - A model describing the coupling between two atoms in a ferromagnetic lattice, in which the interaction energy is proportional to the negative of the product of the spin components along a specified axis.

DEFINITIONS OF SCIENTIFIC TERMS (continued)

- Isobar** - A line connecting points of equal pressure on a graphical representation of a physical system.
- Isochore** - A line or surface of constant volume on a graphical representation of a physical system.
- Isoelectric point*** - The pH of a solution or dispersion at which the net charge on the macromolecules or colloidal particles is zero. In electrophoresis there is no motion of the particles in an electric field at the isoelectric point.
- Isomers** - In chemistry, compounds that have identical molecular formulas but differ in the nature or sequence of bonding of their atoms or in the arrangement of their atoms in space. In physics, nuclei of the same atomic number Z and mass number A but in different energy states. [3]
- Isomorphs** - Substances of different chemical nature but having the same crystal structure.
- Isotactic macromolecule** - A tactic macromolecule, essentially comprising only one species of repeating unit which has chiral or prochiral atoms in the main chain in a unique arrangement with respect to its adjacent constitutional units. [8]
- Isotherm** - A line connecting points of equal temperature on a graphical representation of a physical system.
- Isothermal process** - A thermodynamic process in which the temperature of the system does not change.
- Isotones** - Nuclides having the same neutron number N but different atomic number Z . [3]
- Isotopes** - Two or more nuclides with the same atomic number Z but different mass number A . The term is sometimes used synonymously with nuclide, but it is preferable to reserve the word nuclide for a species of specific Z and A . [3]
- Jahn-Teller effect** - An interaction of vibrational and electronic motions in a nonlinear molecule which removes the degeneracy of certain electronic energy levels. It can influence the spectrum, crystal structure, and magnetic properties of the substance.
- Johnson noise** - Electrical noise generated by random thermal motion of electrons in a conductor or semiconductor. Also called thermal noise.
- Josephson effect** - The tunneling of electron pairs through a thin insulating layer which separates two superconductors. When a potential difference is applied to the superconductors, an alternating current is generated whose frequency is precisely proportional to the potential difference. This effect has important applications in metrology and determination of fundamental physical constants.
- Joule (J)*** - The SI unit of energy, equal to N m. [1]
- Joule-Thomson coefficient (μ)** - A parameter which describes the temperature change when a gas expands adiabatically through a nozzle from a high pressure to a low pressure region. It is defined by $\mu = (\partial T / \partial p)_H$, where H is enthalpy.
- Julian calendar** - The calendar introduced by Julius Caesar in 46 B.C. which divided the year into 365 days with a leap year of 366 days every fourth year.
- Julian date (JD)** - The number of days elapsed since noon Greenwich Mean Time on January 1, 4713 B.C. Thus January 1, 2000, 0h (midnight) will be JD 2,451,543.5. This dating system was introduced by Joseph Scaliger in 1582.
- Kaon** - One of the elementary particles in the family of mesons. Kaons have a spin of zero and may be neutral or charged.
- Kelvin (K)*** - The SI base unit of thermodynamic temperature. [1]
- Kepler's laws** - The three laws of planetary motion, which established the elliptical shape of planetary orbits and the relation between orbital dimensions and the period of rotation.
- Kerr effect*** - An electrooptical effect in which birefringence is induced in a liquid or gas when a strong electric field is applied perpendicular to the direction of an incident light beam. The Kerr constant k is given by $n_1 - n_2 = k\lambda E^2$, where λ is the wavelength, E is the electric field strength, and n_1 and n_2 are the indices of refraction of the ordinary and extraordinary rays, respectively.
- Ketenes** - Compounds in which a carbonyl group is connected by a double bond to an alkylidene group: $R_2C=C=O$. [5]
- Ketones** - Compounds in which a carbonyl group is bonded to two carbon atoms: $R_1R_2C=O$ (neither R may be H). [5]
- Kilogram (kg)*** - The SI base unit of mass. [1]
- Kinetic energy (E_k, T)** - The energy associated with the motion of a system of particles in a specified reference frame. For a single particle of mass m moving at velocity v , $E_k = 1/2mv^2$.
- Kirchhoff's laws** - Basic rules for electric circuits, which state (a) the algebraic sum of the currents at a network node is zero and (b) the algebraic sum of the voltage drops around a closed path is zero.
- Klein-Gordon equation** - A relativistic extension of the Schrödinger equation.
- Klein-Nishina formula** - An expression for the scattering cross section of a photon by an unbound electron, based upon the Dirac electron theory.
- Knight shift** - The change in magnetic resonance frequency of a nucleus in a metal relative to the same nucleus in a diamagnetic solid. The effect is due to the polarization of the conduction electrons in the metal.
- Knudsen number (Kn)** - A dimensionless quantity used in fluid mechanics, defined by $Kn = \lambda/l$, where λ is mean free path and l is length. [2]
- Kondo effect** - A large increase in electrical resistance observed at low temperatures in certain dilute alloys of a magnetic metal in a nonmagnetic material.
- Kramers-Kronig relation** - A set of equations relating the real and imaginary parts of the index of refraction of a medium
- Lactams** - Cyclic amides of amino carboxylic acids, having a 1-azacycloalkan-2-one structure, or analogues having unsaturation or heteroatoms replacing one or more carbon atoms of the ring. [5]
- Lactones** - Cyclic esters of hydroxy carboxylic acids, containing a 1-oxacycloalkan-2-one structure, or analogues having unsaturation or heteroatoms replacing one or more carbon atoms of the ring. [5]
- Lagrangian function (L)** - A function used in classical mechanics, defined as the kinetic energy minus the potential energy for a system of particles.
- Lamb shift** - The small energy difference between the $^2S_{1/2}$ and $^2P_{1/2}$ levels in the hydrogen atom, which results from interactions between the electron and the radiation field.
- Laminar flow** - Smooth, uniform, non-turbulent flow of a gas or liquid in parallel layers, with little mixing between layers. It is characterized by small values of the Reynolds number.
- Landé g -factor** - See g -Factor of the electron
- Langevin function** - The mathematical function $L(x) = (e^x + e^{-x}) / (e^x - e^{-x}) - 1/x$, which occurs in the expression for the average dipole moment of a group of rotating polar molecules in an electric field: $\mu_{av} = \mu L(\mu E / kT)$, where μ is the electric dipole moment of a single molecule, E is the electric field strength, k is the Boltzmann constant, and T is the temperature.
- Lanthanides** - The elements of atomic number 57 through 71, which share common chemical properties: La, Ce, Pr, Nd, Pm, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu. [7]
- Larmor frequency (ν_L)** - The precession frequency of a magnetic dipole in an applied magnetic field. In particular, a nucleus in a magnetic field of strength B has a Larmor frequency of $\gamma B / 2\pi$, where γ is the magnetogyric ratio of the nucleus.
- Laser*** - A device in which an optical cavity is filled with a medium where a population inversion can be produced by some means. When the resonant frequency of the cavity bears the proper relation to the separation of the inverted energy levels, stimulated emission occurs, producing a highly monochromatic, coherent beam of light.

DEFINITIONS OF SCIENTIFIC TERMS (continued)

- Laser ionization mass spectroscopy (LIMS)** - See Techniques for Materials Characterization, page 12-1.
- Lattice constants*** - Parameters specifying the dimensions of a unit cell in a crystal lattice, specifically the lengths of the cell edges and the angles between them.
- Lattice energy*** - The energy per ion pair required to separate completely the ions in a crystal lattice at a temperature of absolute zero.
- Laue diagram** - A diffraction pattern produced when an x-ray beam passes through a thin slice of a crystal and impinges on a detector behind the crystal.
- Lenz's law** - The statement that the current induced in a circuit by a change in magnetic flux is so directed as to oppose the change in flux.
- Leonard-Jones potential** - A simple but useful function for approximating the interaction between two neutral atoms or molecules separated by a distance r by writing the potential energy as $U(r) = 4\epsilon\{(r_0/r)^{12} - (r_0/r)^6\}$, where ϵ and r_0 are adjustable parameters. In this form the depth of the potential well is ϵ and the minimum occurs at $2^{1/6}r_0$. The $(1/r)^{12}$ term is often replaced by other powers of $1/r$.
- Lepton** - One of the class of elementary particles that do not take part in the strong interaction. Included are the electron, muon, and neutrino. All leptons have a spin of $1/2$.
- Lewis number (Le)** - A dimensionless quantity used in fluid mechanics, defined by $Le = a/D$, where a is thermal diffusivity and D is diffusion coefficient. [2]
- Ligand field theory** - A description of the structure of crystals containing a transition metal ion surrounded by nonmetallic ions (ligands). It is based on construction of molecular orbitals involving the d -orbitals of the central metal ion and combinations of atomic orbitals of the ligands.
- Light year (l.y.)** - A unit of distance used in astronomy, defined as the distance light travels in one year in a vacuum. Its approximate value is 9.46073×10^{15} m.
- Lignins** - Macromolecular constituents of wood related to lignans, composed of phenolic propylbenzene skeletal units, linked at various sites and apparently randomly. [5]
- Ligroin** - The petroleum fraction consisting mostly of C_7 and C_8 hydrocarbons and boiling in the range 90-140°C; commonly used as a laboratory solvent.
- Lipids** - A loosely defined term for substances of biological origin that are soluble in nonpolar solvents. They consist of saponifiable lipids, such as glycerides (fats and oils) and phospholipids, as well as nonsaponifiable lipids, principally steroids. [5]
- Lipoproteins** - Clathrate complexes consisting of a lipid enwrapped in a protein host without covalent binding, in such a way that the complex has a hydrophilic outer surface consisting of all the protein and the polar ends of any phospholipids. [5]
- Liter (L)*** - A synonym for cubic decimeter. [1]
- Lithosphere*** - The outer layer of the solid earth, extending from the base of the mantle to the surface of the crust.
- Lorentz contraction** - The reduction in length of a moving body in the direction of motion, given by the factor $(1-v^2/c^2)^{1/2}$, where v is the velocity of the body and c the velocity of light. Also known as the FitzGerald-Lorentz contraction.
- Lorentz force** - The force exerted on a point charge Q moving at velocity v in the presence of external fields E and B . It is given (in SI units) by $F = Q(E + v \times B)$.
- Loss angle (δ)** - For a dielectric material in an alternating electromagnetic field, δ is the phase difference between the current and the potential difference. The function $\tan \delta$ is a measure of the ratio of the power dissipated in the dielectric to the power stored.
- Low energy electron diffraction (LEED)** - See Techniques for Materials Characterization, page 12-1.
- Lumen (lm)*** - The SI unit of luminous flux, equal to cd sr . [1]
- Luminous flux (Φ)** - The intensity of light from a source multiplied by the solid angle. The SI unit is lumen. [1]
- Lux (lx)*** - The SI unit of illuminance, equal to cd sr m^{-2} . [1]
- Lyddane-Sachs-Teller relation** - A relation between the phonon frequencies and dielectric constants of an ionic crystal which states that $(\omega_T/\omega_L)^2 = \epsilon(\infty)/\epsilon(0)$, where ω_T is the angular frequency of transverse optical phonons, ω_L that of longitudinal optical phonons, $\epsilon(0)$ is the static dielectric constant, and $\epsilon(\infty)$ the dielectric constant at optical frequencies.
- Lyman series** - The series of lines in the spectrum of the hydrogen atom which corresponds to transitions between the ground state (principal quantum number $n = 1$) and successive excited states. The wavelengths are given by $1/\lambda = R_H(1-1/n^2)$, where $n = 2, 3, 4, \dots$ and R_H is the Rydberg constant for hydrogen. The first member of the series ($n = 1 \leftrightarrow 2$), which is often called the Lyman- α line, falls at a wavelength of 1216 Å, and the series converges at 912 Å, the ionization limit of hydrogen.
- Mach number (Ma)** - A dimensionless quantity used in fluid mechanics, defined by $Ma = v/c$, where v is velocity and c is the speed of sound. [2]
- Macromolecule** - A molecule of high relative molecular mass (molecular weight), the structure of which essentially comprises the multiple repetition of units derived, actually or conceptually, from molecules of low relative molecular mass [8]
- Madelung constant*** - A constant characteristic of a particular crystal-line material which gives a measure of the electrostatic energy binding the ions in the crystal.
- Magnetic field strength (H)** - An axial vector quantity, the curl of which is equal to the current density, including the displacement current. [1]
- Magnetic induction (B)** - An axial vector quantity such that the force exerted on an element of current is equal to the vector product of this element and the magnetic induction. [1]
- Magnetic moment** - See Dipole moment, magnetic.
- Magnetic susceptibility (χ_m, κ)*** - Defined by $\chi_m = (\mu - \mu_0)/\mu_0$, where μ is the permeability of the medium and μ_0 the permeability of a vacuum. [1]
- Magnetization (M)** - Defined by $M = (B/\mu_0) - H$, where B is magnetic induction, H magnetic field strength, and μ_0 the permeability of a vacuum. [1]
- Magnetogyric ratio (γ)** - Ratio of the magnetic moment of a particle to its angular momentum. Also called gyromagnetic ratio.
- Magneton** - See Bohr magneton, Nuclear magneton.
- Magnetostriction*** - The change in dimensions of a solid sample when it is placed in a magnetic field.
- Magnon** - A quantum of magnetic energy associated with a spin wave in a ferromagnetic or antiferromagnetic crystal.
- Mantle** - The layer of the earth between the crust and the liquid outer core, which begins about 2900 km below the earth's surface.
- Maser** - A device in which a microwave cavity is filled with a medium where a population inversion can be produced by some means. When the resonant frequency of the cavity bears the proper relation to the separation of the inverted energy levels, the device can serve as an amplifier or oscillator at that frequency.
- Mass (m)*** - Quantity of matter. Mass can also be defined as "resistance to acceleration".
- Mass defect (B)** - Defined by $B = Zm(^1\text{H}) + Nm_n - m_a$, where Z is the atomic number, $m(^1\text{H})$ is the mass of the hydrogen atom, N is the neutron number, m_n is the rest mass of the neutron, and m_a is the mass of the atom in question. Thus Bc^2 can be equated to the binding energy of the nucleus if the binding energy of atomic electrons is neglected. [1]
- Mass excess (Δ)** - Defined by $\Delta = m_a - Am_u$, where m_a is the mass of the

DEFINITIONS OF SCIENTIFIC TERMS (continued)

- atom, A the number of nucleons, and m_u the unified atomic mass constant ($m_u = 1 \text{ u}$). [1]
- Mass fraction (w_B)** - The ratio of the mass of substance B to the total mass of a mixture. [1]
- Mass number (A)** - A characteristic property of a specific isotope of an element, equal to the sum of the number of protons and neutrons in the nucleus.
- Mass spectrometry** - An analytical technique in which ions are separated according to the mass/charge ratio and detected by a suitable detector. The ions may be produced by electron impact on a gas, a chemical reaction, energetic vaporization of a solid, etc. [6]
- Massieu function** - A thermodynamic function defined by $J = -A/T$, where A is the Helmholtz energy and T the thermodynamic temperature. [2]
- Matthiessen's rule** - The statement that the electrical resistivity ρ of a metal can be written as $\rho = \rho_L + \rho_i$, where ρ_L is due to scattering of conduction electrons by lattice vibrations and ρ_i to scattering by impurities and imperfections. If the impurity concentration is small, ρ_i is temperature independent.
- Maxwell (Mx)*** - A non-SI unit of magnetic field strength (H) equal to 10^{-8} Wb. [1]
- Maxwell's equations** - The fundamental equations of electromagnetism. In a form appropriate to SI units, they are:
- $$\text{curl } \mathbf{H} = \partial \mathbf{D} / \partial t + \mathbf{j}$$
- $$\text{div } \mathbf{B} = 0$$
- $$\text{curl } \mathbf{E} = -\partial \mathbf{B} / \partial t$$
- $$\text{div } \mathbf{D} = \rho$$
- where \mathbf{H} is the magnetic field strength, \mathbf{B} the magnetic induction, \mathbf{E} the electric field strength, \mathbf{D} the electric displacement, \mathbf{j} the current density, ρ the charge density, and t is time.
- Maxwell-Boltzmann distribution** - An expression for the fraction of molecules $f(v)$ in a gas that have velocity v within a specified interval. It takes the form
- $$f(v) = 4\pi(M/2\pi RT)^{3/2} v^2 e^{-Mv^2/2RT}$$
- where M is the molar mass, R the molar gas constant, and T the temperature.
- Mean free path*** - The average distance a gas molecule travels between collisions.
- Meissner effect** - The complete exclusion of magnetic induction from the interior of a superconductor.
- Melting point*** - The temperature at which the solid and liquid phases of a substance are in equilibrium at a specified pressure (normally taken to be atmospheric unless stated otherwise).
- Mercaptans** - A traditional term abandoned by IUPAC, synonymous with thiols. This term is still widely used. [5]
- Meson** - Any elementary particle that has zero or integral spin. Mesons are responsible for the forces between protons and neutrons in the nucleus.
- Mesosphere** - The part of the earth's atmosphere extending from the top of the stratosphere (about 50 km above the surface) to 80-90 km. It is characterized by a decrease in temperature with increasing altitude.
- Metal** - A material in which the highest occupied energy band (conduction band) is only partially filled with electrons. The electrical conductivity of metals generally decreases with temperature.
- Metalloenes** - Organometallic coordination compounds in which one atom of a transition metal such as iron, ruthenium or osmium is bonded to and only to the face of two cyclopentadienyl ligands which lie in parallel planes. [5]
- Meter (m)*** - The SI base unit of length. [1]
- Methine group** - In organic compounds, the $-C=$ group. [5]
- Mho** - An archaic name for the SI unit siemens (reciprocal ohm).
- Micelle** - A particle formed by the aggregation of surfactant molecules (typically, 10 to 100 molecules) in solution. For aqueous solutions, the hydrophilic end of the molecule is on the surface of the micelle, while the hydrophobic end (often a hydrocarbon chain) points toward the center. At the critical micelle concentration (cmc) the previously dissolved molecules aggregate into a micelle.
- Micron (μ)** - An obsolete name for micrometer.
- Mie scattering** - The scattering of light by spherical dielectric particles whose diameter is comparable to the wavelength of the light.
- Milky way** - The band of light in the night sky resulting from the stars in the galactic plane. The term is also used to denote the galaxy in which the sun is located.
- Miller indices (hkl)** - A set of indices used to label planes in a crystal lattice. [2]
- Millimeter of mercury (mmHg)** - A non-SI unit of pressure, equal to 133.322 Pa. The name is generally considered interchangeable with torr.
- Mobility (μ)*** - In solid state physics, the drift velocity of electrons or holes in a solid divided by the applied electric field strength. The term is used in a similar sense in other fields.
- Molality (m)** - A measure of concentration of a solution in which one states the amount of substance (i.e., number of moles) of solute per kilogram of solvent. Thus a 0.1 molal solution (often written as 0.1 m) has $m = 0.1 \text{ mol/kg}$.
- Molar mass** - The mass of one mole of a substance. It is normally expressed in units of g/mol, in which case its numerical value is identical with the molecular weight (relative molecular mass). [1]
- Molar quantity** - It is often convenient to express an extensive quantity (e.g., volume, enthalpy, heat capacity, etc.) as the actual value divided by amount of substance (number of moles). The resulting quantity is called molar volume, molar enthalpy, etc
- Molar refraction (R)** - A property of a dielectric defined by the equation $R = V_m[(n^2-1)/(n^2+2)]$, where n is the index of refraction of the medium (at optical wavelengths) and V_m the molar volume. It is related to the polarizability α of the molecules that make up the medium by the Lorenz-Lorentz equation, $R = N_A \alpha / 3\epsilon_0$, where N_A is Avogadro's constant and ϵ_0 is the permittivity of a vacuum.
- Molarity (c)** - A measure of concentration of a solution in which one states the amount of substance (i.e., number of moles) of solute per liter of solution. Thus a 0.1 molar solution (often referred to as 0.1 M) has a concentration $c = 0.1 \text{ mol/L}$.
- Mole (mol)*** - The SI base unit of amount of substance. [1]
- Mole fraction (x_B)** - The ratio of the amount of substance (number of moles) of substance B to the total amount of substance in a mixture. [1]
- Molecular orbital** - See Orbital.
- Molecular weight (M_r)*** - The ratio of the average mass per molecule or specified entity of a substance to 1/12 of the mass of nuclide ^{12}C . Also called relative molar (or molecular) mass. [1]
- Moment of inertia (I)** - The moment of inertia of a body about an axis is the sum (or integral) of the products of its elements of mass and the squares of their distances from the axis. [1]
- Momentum (p)** - The product of mass and velocity. [1]
- Monomer** - A substance consisting of molecules which can undergo polymerization, thereby contributing constitutional units to the essential structure of a macromolecule. [8]
- Monosaccharides** - A term which includes aldoses, ketoses, and a wide variety of derivatives. [5]
- Mössbauer effect** - The recoilless emission of γ -rays from nuclei bound in a crystal under conditions where the recoil energy associated with the γ emission is taken up by the crystal as a whole. This results in a very narrow line width, which can be exploited in various types of precise measurements.

DEFINITIONS OF SCIENTIFIC TERMS (continued)

- Muon*** - An unstable elementary particle of spin 1/2 and mass about 200 times that of the electron.
- Naphtha** - The petroleum fraction consisting mostly of C₆ to C₈ hydrocarbons and boiling in the range 80-120°C. Solvents derived from this fraction include ligroin and petroleum ether.
- Nautical mile** - A non-SI unit of length, equal to exactly 1852 m.
- Navier-Stokes equations** - A set of complex equations for the motion of a viscous fluid subject to external forces.
- Néel temperature (T_N)*** - The critical temperature above which an antiferromagnetic substance becomes paramagnetic. [1]
- Nernst effect** - The production of an electric field in a conductor subject to an applied magnetic field and containing a transverse temperature gradient. The electric field is perpendicular to the magnetic field and the temperature gradient.
- Network** - In polymer science, a highly ramified macromolecule in which essentially each constitutional unit is connected to each other constitutional unit and to the macroscopic phase boundary by many permanent paths through the macromolecule, the number of such paths increasing with the number of intervening bonds. The paths must on the average be coextensive with the macromolecule. [8]
- Neutrino** - A stable elementary particle in the lepton family. Neutrinos have zero (or at least near-zero) rest mass and spin 1/2.
- Neutron*** - An elementary particle on spin 1/2 and zero charge. The free neutron has a mean lifetime of 887 seconds. Neutrons and protons, which are collectively called nucleons, are the constituents of the nucleus.
- Neutron activation analysis (NAA)** - See Techniques for Materials Characterization, page 12-1.
- Neutron number (N)** - A characteristic property of a specific isotope of an element, equal to the number of neutrons in the nucleus.
- Newton (N)*** - The SI unit of force, equal to m kg s⁻². [1]
- Nitriles** - Compounds having the structure RC≡N; thus C-substituted derivatives of hydrocyanic acid, HC≡N. [5]
- Nitrosamines** - N-Nitroso amines: compounds of the structure R₂NNO. Compounds RNHNO are not ordinarily isolatable, but they, too, are nitrosamines. The name is a contraction of N-nitrosoamine and, as such, does not require the N locant. [5]
- Nuclear magnetic resonance (NMR)*** - A widely used technique in which the resonant absorption of radiofrequency radiation by magnetic nuclei in a magnetic field is measured. The results give important information on the local environment of each nucleus.
- Nuclear magneton (μ_N)*** - The unit of nuclear magnetic moment, defined as $eh/4\pi m_p$, where h is Planck's constant, m_p the proton mass, and e the elementary charge.
- Nuclear quadrupole resonance (NQR)** - See Techniques for Materials Characterization, page 12-1.
- Nuclear reaction analysis (NRA)** - See Techniques for Materials Characterization, page 12-1.
- Nuclear spin (I)** - The quantum number that specifies the intrinsic angular momentum of a particular nucleus. The magnitude of the angular momentum is given by $[I(I+1)]^{1/2} h/2\pi$, where h is Planck's constant.
- Nucleic acids*** - Macromolecules, the major organic matter of the nuclei of biological cells, made up of nucleotide units, and hydrolyzable into certain pyrimidine or purine bases (usually adenine, cytosine, guanine, thymine, uracil), D-ribose or 2-deoxy-D-ribose. [5]
- Nucleon** - A collective term for the proton and neutron.
- Nucleosides** - Ribosyl or deoxyribosyl derivatives (rarely, other glycosyl derivatives) of certain pyrimidine or purine bases. They are thus glycosylamines or N-glycosides related to nucleotides by the lack of phosphorylation. [5]
- Nucleotides** - Compounds formally obtained by esterification of the 3' or 5' hydroxy group of nucleosides with phosphoric acid. They are the monomers of nucleic acids and are formed from them by hydrolytic cleavage. [5]
- Nuclide** - A species of atoms in which each atom has identical atomic number Z and identical mass number A . [3]
- Nusselt number (Nu)** - A dimensionless quantity used in fluid mechanics, defined by $Nu = hl/k$, where h is coefficient of heat transfer, l is length, and k is thermal conductivity. [2]
- Nyquist theorem** - An expression for the mean square thermal noise voltage across a resistor, given by $4RkT\Delta f$ where R is the resistance, k the Boltzmann constant, T the temperature, and Δf the frequency band within which the voltage is measured.
- Octanol-water partition coefficient (P)*** - A measure of the way in which a compound will partition itself between the octanol and water phases in the two-phase octanol-water system, and thus an indicator of certain types of biological activity. Specifically, P is the ratio of the concentration (in moles per liter) of the compound in the octanol phase to that in the water phase at infinite dilution. The quantity normally reported is $\log P$.
- Oersted (Oe)** - A non-SI unit of magnetic field (H), equal to 79.57747 A/m.
- Ohm (Ω)*** - The SI unit of electric resistance, equal to V/A. [1]
- Ohm's law** - A relation among electric current I , potential difference V , and resistance R , viz., $I = V/R$. The resistance is constant at constant temperature to high precision for many materials.
- Olefins** - Acyclic and cyclic hydrocarbons having one or more carbon-carbon double bonds, apart from the formal ones in aromatic compounds. The class olefins subsumes alkenes and cycloalkenes and the corresponding polyenes. [5]
- Oligomer** - A substance consisting of molecules of intermediate relative molecular mass (molecular weight), the structure of which essentially comprises the multiple repetition of units derived, actually or conceptually, from molecules of low relative molecular mass. In contrast to a polymer, the properties of an oligomer can vary significantly with the removal of one or a few of its units. [8]
- Oligopeptides** - Peptides containing from three to nine amino groups. [5]
- Onsager relations** - An important set of equations in the thermodynamics of irreversible processes. They express the symmetry between the transport coefficients describing reciprocal processes in systems with a linear dependence of flux on driving forces.
- Optical rotary power** - Angle by which the plane of polarization of a light beam is rotated by an optically active medium, divided by path length and by concentration of the active constituent. Depending on whether mass or molar concentration is used, the modifier "specific" or "molar" is attached. [2]
- Orbital** - A one-electron wavefunction. Atomic orbitals are classified as s -, p -, d -, or f -orbitals according to whether the angular momentum quantum number $l = 0, 1, 2, \text{ or } 3$. Molecular orbitals, which are usually constructed as linear combinations of atomic orbitals, describe the distribution of electrons over the entire molecule.
- Oscillator strength (f)** - A measure of the intensity of a spectroscopic transition, defined by
- $$f = \frac{8\pi^2 M e v}{3 h e^2} |\mu_{ij}|^2$$
- where v is the frequency, μ_{ij} the transition dipole moment, m_e the mass of the electron, e the elementary charge, and h Planck's constant.
- Osmosis** - The flow of a solvent in a system in which two solutions of different concentration are separated by a semipermeable membrane which cannot pass solute molecules. The solvent will flow from the side of lower concentration to that of higher concentration, thus tending to equalize the concentrations. The pressure that must be

DEFINITIONS OF SCIENTIFIC TERMS (continued)

- applied to the more concentrated side to stop the flow is called the osmotic pressure.
- Osmotic coefficient (ϕ)** - Defined by $\phi = \ln a_A / (M_A \sum m_B)$, where M_A is the molar mass of substance A (normally the solvent), a_A is its activity, and the m_B are molalities of the solutes. [1]
- Osmotic pressure (Π)** - The excess pressure necessary to maintain osmotic equilibrium between a solution and the pure solvent separated by a membrane permeable only to the solvent. In an ideal dilute solution $\Pi = c_B RT$, where c_B is the amount-of-substance concentration of the solute, R is the molar gas constant, and T the temperature. [1,2]
- Ostwald dilution law** - A relation for the concentration dependence of the molar conductivity Λ of an electrolyte solution, viz.,
- $$\frac{1}{\Lambda} = \frac{1}{\Lambda^\circ} + \frac{\Lambda c}{K(\Lambda^\circ)^2}$$
- where c is the solute concentration, K is the equilibrium constant for dissociation of the solute, and Λ° is the conductivity at $c\Lambda = 0$.
- Ounce (oz)** - A non-SI unit of mass. The avoirdupois ounce equals 28.34952 g, while the troy ounce equals 31.10348 g.
- Overpotential (η)** - In an electrochemical cell, the difference between the potential of an electrode and its zero-current value.
- Oximes** - Compounds of structure $R_2C=NOH$ derived from condensation of aldehydes or ketones with hydroxylamine. Oximes from aldehydes may be called aldioximes; those from ketones may be called ketoximes. [5]
- Oxo compounds** - Compounds containing an oxygen atom, =O, doubly bonded to carbon or another element. The term thus embraces aldehydes, carboxylic acids, ketones, sulfonic acids, amides and esters. [5]
- Ozonides** - The 1,2,4-trioxolanes formed by the reaction of ozone at a carbon-carbon double bond, or the analogous compounds derived from acetylenic compounds. [5]
- Pair production** - A process in which a photon is converted into a particle and its antiparticle (e.g., an electron and positron) in the electromagnetic field of a nucleus.
- Paraffins** - Obsolete term for saturated hydrocarbons, commonly but not necessarily acyclic. Still widely used in the petrochemical industry, where the term designates acyclic saturated hydrocarbons, and stands in contradistinction to naphthenes. [5]
- Paramagnetism*** - A type of magnetism characterized by a positive magnetic susceptibility, so that the material becomes weakly magnetized in the direction of an external field. The magnetization disappears when the field is removed. In the simplest approximation (Curie's law) the susceptibility is inversely proportional to temperature.
- Parity** - The property of a quantum-mechanical wave function that describes its behavior under the symmetry operation of coordinate inversion. A parity of +1 (or even) is assigned if the wave function does not change sign when the signs of all the coordinates are changed; the parity is -1 (or odd) if the wave function changes sign under this operation.
- Parsec (pc)** - A unit of distance defined as the distance at which 1 astronomical unit (AU) subtends an angle of 1 second of arc. It is equal to 206264.806 AU or 3.085678×10^{16} m.
- Particle induced x-ray emission (PIXE)** - See Techniques for Materials Characterization, page 12-1.
- Partition function (q, z)** - For a single molecule, $q = \sum_i g_i \exp(\epsilon_i/kT)$, where ϵ_i is an energy level of degeneracy g_i , k the Boltzmann constant, and T the absolute temperature; the summation extends over all energy states. For a system of N non-interacting molecules which are indistinguishable, as in an ideal gas, the canonical partition function $Q = q^N/N!$.
- Pascal (Pa)*** - The SI unit of pressure, equal to N/m^2 . [1]
- Paschen series** - The series of lines in the spectrum of the hydrogen atom which corresponds to transitions between the state with principal quantum number $n = 3$ and successive higher states. The wavelengths are given by $1/\lambda = R_H(1/9 - 1/n^2)$, where $n = 4, 5, 6, \dots$ and R_H is the Rydberg constant. The first member of the series ($n = 3 \leftrightarrow 4$), which is often called the P_α line, falls in the infrared at a wavelength of 1.875 μm .
- Paschen-Back effect** - In atomic spectroscopy, the decoupling of electron spin from orbital angular momentum as the strength of an external magnetic field is increased.
- Pauli exclusion principle** - The statement that two electrons in an atom cannot have identical quantum numbers; thus if there are two electrons in the same orbital, their spin quantum numbers must be of opposite sign.
- Pearson symbol** - A code for designating crystallographic information, including the crystal system, the lattice type, and the number of atoms per unit cell.
- Péclet number (Pe)** - A dimensionless quantity used in fluid mechanics, defined by $Pe = vl/a$, where v is velocity, l is length, and a is thermal diffusivity. [2]
- Peltier effect** - The absorption or generation of heat (depending on the current direction) which occurs when an electric current is passed through a junction between two materials.
- Peptides** - Amides derived from two or more amino carboxylic acid molecules (the same or different) by formation of a covalent bond from the carbonyl carbon of one to the nitrogen atom of another with formal loss of water. [5]
- Permeability (μ)** - Magnetic induction divided by magnetic field strength; i.e. $\mu = B/H$. The relative permeability $\mu_r = \mu/\mu_0$, where μ_0 is the permeability of a vacuum. [1]
- Permittivity (ϵ)** - Ratio of the electric displacement in a medium to the electric field strength. Also called dielectric constant. [1]
- Peroxides** - Compounds of structure ROOR in which R may be any organic group. In inorganic chemistry, salts of the anion O_2^{2-} [5]
- Peroxy acids** - Acids in which an acidic -OH group has been replaced by an -OOH group; e.g. $\text{CH}_3\text{C}(=\text{O})\text{OOH}$ peroxyacetic acid, $\text{PhS}(=\text{O})_2\text{OOH}$ benzeneperoxy sulfonic acid. [5]
- Petroleum ether** - The petroleum fraction consisting of C_5 and C_6 hydrocarbons and boiling in the range 35-60°C; commonly used as a laboratory solvent.
- pH*** - A convenient measure of the acid-base character of a solution, usually defined by $\text{pH} = -\log [c(\text{H}^+)/\text{mol L}^{-1}]$, where $c(\text{H}^+)$ is the concentration of hydrogen ions. The more precise definition is in terms of activity rather than concentration. [2]
- Phenols** - Compounds having one or more hydroxy groups attached to a benzene or other arene ring. [5]
- Phonon** - A quantum of energy associated with a vibrational mode of a crystal lattice.
- Phosphines** - PH_3 and compounds derived from it by substituting one, two or three hydrogen atoms by hydrocarbyl groups. RPH_2 , R_2PH and R_3P (R not equal to H) are called primary, secondary and tertiary phosphines, respectively. [5]
- Phosphonium compounds** - Salts (and hydroxides) $[\text{R}_4\text{P}]^+\text{X}^-$ containing tetracoordinate phosphonium ion and the associated anion. [5]
- Phosphonium ylides** - Compounds having the structure $\text{R}_3\text{P}^+-\text{C}^-\text{R}_2$ 1 $\text{R}_3\text{P}=\text{CR}_2$ 2. Also known as Wittig reagents. [5]
- Phosphorescence** - The process by which a molecule is excited by light to a higher electronic state and then undergoes a radiationless transition to a state of different multiplicity from which it decays, after some delay, to the ground state. The emitted light is normally of longer wavelength than the exciting light because vibrational energy has been dissipated.

DEFINITIONS OF SCIENTIFIC TERMS (continued)

Photoelectric effect - The complete absorption of a photon by a solid with the emission of an electron.

Photon - An elementary particle of zero mass and spin 1/2. The photon is involved in electromagnetic interactions and is the quantum of electromagnetic radiation.

Photon stimulated desorption (PSD) - See Techniques for Materials Characterization, page 12-1.

Pinacols - Tetra(hydrocarbyl)ethane-1,2-diols, $R_2C(OH)C(OH)R_2$, of which the tetramethyl example is the simplest one and is itself commonly known as pinacol. [5]

Pion - An elementary particle in the family of mesons. Pions have zero spin and may be neutral or charged. They participate in the strong interaction which holds the nucleus together.

pK* - The negative logarithm (base 10) of an equilibrium constant K . For pK_a , see Acid dissociation constant.

Planck constant (h)* - The elementary quantum of action, which relates energy to frequency through the equation $E = hv$.

Planck distribution - See Black body radiation

Planck function - A thermodynamic function defined by $Y = -G/T$, where G is Gibbs energy and T thermodynamic temperature. [2]

Plasma - A highly ionized gas in which the charge of the electrons is balanced by the charge of the positive ions, so that the system as a whole is electrically neutral.

Plasmon - A quantum associated with a plasma oscillation in the electron gas of a solid.

Point group* - A group of symmetry operations (rotations, reflections, etc.) that leave a molecule invariant. Every molecular conformation can be assigned to a specific point group, which plays a major role in determining the spectrum of the molecule.

Poise (P) - A non-SI unit of viscosity, equal to 0.1 Pa s.

Poiseuille's equation - A formula for the rate of flow of a viscous fluid through a tube:

$$\frac{dV}{dt} = \frac{(p_1^2 - p_2^2)\pi r^4}{16l\eta p_0}$$

where V is the volume as measured at pressure p_0 ; p_1 and p_2 are the pressures at each end of the tube; r is the radius and l the length of the tube; and η is the viscosity.

Poisson ratio (μ) - The absolute value of the ratio of the transverse strain to the corresponding axial strain resulting from uniformly distributed axial stress below the proportional limit (i.e., where Hooke's law is valid). [10]

Polariton - A quantum associated with the coupled modes of photons and optical phonons in an ionic crystal.

Polarizability (α)* - The change in dipole moment of a molecule produced by an external electric field; specifically, $\alpha_{ab} = \partial p_a / \partial E_b$, where p_a is the dipole moment component on the a axis and E_b is the component of the electric field strength along the b axis. [2]

Polymer - A substance composed of molecules of high relative molecular mass (molecular weight), the structure of which essentially comprises the multiple repetition of units derived, actually or conceptually, from molecules of low relative molecular mass. A single molecule of a polymer is called a macromolecule. [8]

Polypeptides - Peptides containing 10 or more amino acid residues. See also Peptides. [5]

Polysaccharides - Compounds consisting of a large number of monosaccharides linked glycosidically. This term is commonly used only for those containing more than ten monosaccharide residues. Also called glycans. [5]

Porphyryns - Natural pigments containing a fundamental skeleton of four pyrrole nuclei united through the α -positions by four methine groups

to form a macrocyclic structure (porphyrin is designated porphine in Chemical Abstracts indexes). [5]

Positron - The antiparticle of the electron. It has the same mass and spin as an electron, and an equal but opposite charge.

Positronium - The hydrogen-like "atom" formed from a positron nucleus and an electron. Its lifetime is very short because of annihilation of the positron and electron.

Potential - See Electric potential

Potential energy (E_p, V, U) - The portion of the energy of a system that is associated with its position in a force field.

Pound (lb) - A non-SI unit of mass, equal to 0.4535924 kg.

Power (P) - Rate of energy transfer. For electrical circuits, this is equal to the product of current and potential difference, $P = IV$. [1]

Poynting vector (S) - For electromagnetic radiation, the vector product of the electric field strength and the magnetic field strength. [1]

Prandtl number (Pr) - A dimensionless quantity used in fluid mechanics, defined by $Pr = \eta/\rho a$, where η is viscosity, ρ is density, and a is thermal diffusivity. [2]

Pressure* - Force divided by area. [1]

Proteins - Naturally occurring and synthetic polypeptides having molecular weights greater than about 10,000 (the limit is not precise). See also Peptides. [5]

Proton* - A stable elementary particle of unit positive charge and spin 1/2. Protons and neutrons, which are collectively called nucleons, are the constituents of the nucleus.

Pulsar - A neutron star which rotates rapidly and emits electromagnetic radiation in regular pulses at a frequency related to the rotation period.

Purine bases* - Purine and its substitution derivatives, especially naturally occurring examples. [5]

Pyrimidine bases* - Pyrimidine and its substitution derivatives, especially naturally occurring examples. [5]

Q-switching - A technique for obtaining very high power from a laser by keeping the Q factor of the laser cavity low while the population inversion builds up, then suddenly increasing the Q to initiate the stimulated emission.

Quad - A unit of energy defined as 10^{15} Btu, equal to approximately 1.055056×10^{18} J.

Quadrupole moment - A coefficient of the third term (after monopole and dipole) in the power series expansion of the electric potential of an array of charges. A nucleus of spin greater than 1/2 has a non-vanishing nuclear quadrupole moment which can interact with the electric field gradient of the surrounding electrons. Molecular quadrupole moments have an influence on intermolecular forces.

Quality factor (Q) - The ratio of the absolute value of the reactance of an electrical system to the resistance; thus a measure of the energy stored per cycle relative to the energy dissipated.

Quantum yield - In photochemistry, the number of moles transformed in a specific process, either physically (e.g., by emission of photons) or chemically, per mole of photons absorbed by the system. [3]

Quark - An elementary entity which has not been directly observed but is considered a constituent of protons, neutrons, and other hadrons.

Quasar - An extragalactic object emitting electromagnetic radiation at a very high power level and showing a very large red shift, thus indicating that the object is receding at a speed approaching the speed of light.

Quasicrystal - A solid having conventional crystalline properties but whose lattice does not display translational periodicity.

Quaternary ammonium compounds - Derivatives of ammonium compounds, $NH_4^+ Y^-$, in which all four of the hydrogens bonded to nitrogen have been replaced with hydrocarbyl groups. Compounds having a carbon-nitrogen double bond (i.e. $R_2C=N^+R_2 Y^-$) are more accurately called iminium compounds. [5]

DEFINITIONS OF SCIENTIFIC TERMS (continued)

- Quinones** - Compounds having a fully conjugated cyclic dione structure, such as that of benzoquinones, derived from aromatic compounds by conversion of an even number of -CH= groups into -C(=O)- groups with any necessary rearrangement of double bonds. [5]
- Racemic mixture** - A mixture of equal amounts of a pair of enantiomers (optical isomers); such a mixture is not optically active.
- Rad** - A non-SI unit of absorbed dose of radiation, equal to 0.01 Gy.
- Radiance (*L*)** - The radiant intensity in a given direction from an element of a surface, divided by the area of the orthogonal projection of this element on a plane perpendicular to the given direction. [1]
- Radiant intensity (*I*)** - The radiant energy flux leaving an element of a source within an element of solid angle, divided by that element of solid angle. [1]
- Radicals** - Molecular entities possessing an unpaired electron, such as ·CH₃, ·SnH₃, ·Cl. (In these formulas the dot, symbolizing the unpaired electron, should be placed so as to indicate the atom of highest spin density, if this is possible). [5]
- Raman effect** - The inelastic scattering of light by a molecule, in which the incident photon either gives up to, or receives energy from, one of the internal vibrational modes of the molecule. The scattered light thus has either a lower frequency (Stokes radiation) or higher frequency (anti-Stokes radiation) than the incident light. These shifts provide a measure of the normal vibrational frequencies of the molecule.
- Rankine cycle** - A thermodynamic cycle which can be used to calculate the ideal performance of a heat engine that uses a condensable vapor as the working fluid (e.g., a steam engine or a heat pump).
- Rankine temperature** - A thermodynamic temperature scale based on a temperature interval °R = (5/9) K; i.e., $T/^{\circ}\text{R} = (9/5)T/\text{K} = t/^{\circ}\text{F} + 459.67$.
- Raoult's law** - The expression for the vapor pressure p_i of component i in an ideal solution, viz., $p_i = x_i p_{i0}$, where x_i is the mole fraction of component i and p_{i0} the vapor pressure of the pure substance i .
- Rare earth elements** - The elements Sc, Y, and the lanthanides (La, Ce, Pr, Nd, Pm, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu). [7]
- Rayleigh number (*Ra*)** - A dimensionless quantity used in fluid mechanics, defined by $Ra = \beta g \alpha \Delta T l^3 / \eta a$, where l is length, g is acceleration of gravity, α is cubic expansion coefficient, T is temperature, ρ is density, η is viscosity, and a is thermal diffusivity. [2]
- Rayleigh scattering** - The scattering of light by particles which are much smaller than the wavelength of the light. It is characterized by a scattered intensity which varies as the inverse fourth power of the wavelength.
- Rayleigh wave** - A guided elastic wave along the surface of a solid; also called surface acoustic wave.
- Reactance (*X*)** - The imaginary part of impedance. For an inductive reactance L and a capacitive reactance C in series, the reactance is $X = L\omega - 1/(C\omega)$, where ω is 2π times the frequency of the current. [1]
- Red shift** - A displacement of a spectral line toward longer wavelengths. This can occur through the Doppler effect (e.g., in the light from receding galaxies) or, in the general theory of relativity, from the effects of a star's gravitational field.
- Reflectance (ρ)** - Ratio of the radiant or luminous flux at a given wavelength that is reflected to that of the incident radiation. Also called reflection factor. [1]
- Reflection high energy electron diffraction (RHEED)** - See Techniques for Materials Characterization, page 12-1.
- Relative humidity*** - The ratio of the partial pressure of water vapor in air to the saturation vapor pressure of water at the same temperature, expressed as a percentage. [10]
- Relative molar mass** - See Molecular weight.
- Rem** - A non-SI unit of dose equivalent, equal to 0.01 Sv.
- Resistance (*R*)** - Electric potential difference divided by current when there is no electromotive force in the conductor. This definition applies to direct current. More generally, resistance is defined as the real part of impedance. [1]
- Resistivity (ρ)** - Electric field strength divided by current density when there is no electromotive force in the conductor. Resistivity is an intrinsic property of a material. For a conductor of uniform cross section with area A and length L , and whose resistance is R , the resistivity is given by $\rho = RA/L$. [1]
- Reynolds number (*Re*)** - A dimensionless quantity used in fluid mechanics, defined by $Re = \rho vl/\eta$, where ρ is density, v is velocity, l is length, and η is viscosity. [2]
- Rheology** - The study of the flow of liquids and deformation of solids. Rheology addresses such phenomena as creep, stress relaxation, anelasticity, nonlinear stress deformation, and viscosity.
- Ribonucleic acids (RNA)** - Naturally occurring polyribonucleotides. See also nucleic acids, nucleosides, nucleotides, ribonucleotides. [5]
- Ribonucleotides** - Nucleotides in which the glycosyl group is a ribosyl group. See also nucleotides. [5]
- Roentgen (*R*)** - A unit used for expressing the charge (positive or negative) liberated by x-ray or γ radiation in air, divided by the mass of air. A roentgen is defined as 2.58×10^{-4} C/kg.
- Rotational constants** - In molecular spectroscopy, the constants appearing in the expression for the rotational energy levels as a function of the angular momentum quantum numbers. These constants are proportional to the reciprocals of the principal moments of inertia, averaged over the vibrational motion.
- Rutherford back scattering (RBS)** - See Techniques for Materials Characterization, page 12-1.
- Rydberg constant (R_{∞})*** - The fundamental constant which appears in the equation for the energy levels of hydrogen-like atoms; i.e., $E_n = hcR_{\infty} Z^2 \mu/n^2$, where h is Planck's constant, c the speed of light, Z the atomic number, μ the reduced mass of nucleus and electron, and n the principal quantum number ($n = 1, 2, \dots$).
- Rydberg series** - A regular series of lines in the spectrum of an atom or molecule, with the spacing between successive lines becoming smaller as the frequency increases (wavelength decreases). The series eventually converges to a limit which usually corresponds to the complete removal of an electron from the atom or molecule.
- Sackur-Tetrode equation*** - An equation for the molar entropy S_m of an ideal monatomic gas: $S_m = R \ln(e^{5/2} V/N_A \Lambda^3)$, where R is the molar gas constant, V is the volume, and N_A is Avogadro's number. The constant Λ is given by $\Lambda = h/(2\pi mkT)^{1/2}$, where h is Planck's constant, m the atomic mass, k the Boltzmann constant, and T the temperature.
- Salinity (*S*)*** - A parameter used in oceanography to describe the concentration of dissolved salts in seawater. It is defined in terms of electrical conductivity relative to a standard solution of KCl. When expressed in units of parts per thousand, S may be roughly equated to the concentration of dissolved material in grams per kilogram of seawater.
- Salt** - An ionic compound formed by the reaction of an acid and a base.
- Scanned probe microscopy (SPM)** - See Techniques for Materials Characterization, page 12-1.
- Scanning electron microscopy (SEM)** - See Techniques for Materials Characterization, page 12-1.
- Scanning laser acoustic microscopy (SLAM)** - See Techniques for Materials Characterization, page 12-1.
- Scanning transmission electron microscopy (STEM)** - See Techniques for Materials Characterization, page 12-1.
- Scanning tunneling microscopy (STM)** - See Techniques for Materials Characterization, page 12-1.
- Schiff bases** - Imines bearing a hydrocarbyl group on the nitrogen atom: $R_2C=NR'$ (R' not equal to H). Considered by many to be synonymous with azomethines. [5]

DEFINITIONS OF SCIENTIFIC TERMS (continued)

Schmidt number (Sc) - A dimensionless quantity used in fluid mechanics, defined by $Sc = \eta/\rho D$, where η is viscosity, ρ is density, and D is diffusion coefficient. [2]

Schottky barrier - A potential barrier associated with a metal-semiconductor contact. It forms the basis for the rectifying device known as the Schottky diode.

Schrödinger equation - The basic equation of wave mechanics which, for systems not dependent on time, takes the form:

$$-(\hbar/2m)\nabla^2\psi + V\psi = E\psi$$

where ψ is the wavefunction, V is the potential energy expressed as a function of the spatial coordinates, E is an energy eigenvalue, ∇^2 is the Laplacian operator, \hbar is Planck's constant divided by 2π , and m is the mass.

Second (s)* - The SI base unit of time. [1]

Second radiation constant (c_2)* - See First radiation constant.

Secondary ion mass spectroscopy (SIMS) - See Techniques for Materials Characterization, page 12-1.

Seebeck effect - The development of a potential difference in a circuit where two different metals or semiconductors are joined and their junctions maintained at different temperatures. It is the basis of the thermocouple.

Selenides - Compounds having the structure $RSeR$ (R not equal to H). They are thus selenium analogues of ethers. Also used for metal salts of H_2Se . [5]

Semicarbazones - Compounds having the structure $R_2C=NNHC(=O)NH_2$, formally derived by condensation of aldehydes or ketones with semicarbazide $[NH_2NHC(=O)NH_2]$. [5]

Semiconductor - A material in which the highest occupied energy band (valence band) is completely filled with electrons at $T = 0$ K, and the energy gap to the next highest band (conduction band) ranges from 0 to 4 or 5 eV. With increasing temperature electrons are excited into the conduction band, leading to an increase in the electrical conductivity.

Semiquinones - Radical anions having the structure $-O-Z-O\cdot$ where Z is an ortho- or para-arylene group or analogous heteroarylene group; they are formally generated by the addition of an electron to a quinone. [5]

SI units* - The International System of Units adopted in 1960 and recommended for use in all scientific and technical fields. [1]

Siemens (S)* - The SI unit of electric conductance, equal to Ω^{-1} . [1]

Sievert (Sv)* - The SI unit of dose equivalent (of radiation), equal to J/kg. [1]

Silanes - Saturated silicon hydrides, analogues of the alkanes; i.e. compounds of the general formula Si_nH_{2n+2} . Silanes may be subdivided into silane, oligosilanes, and polysilanes. Hydrocarbyl derivatives are often referred to loosely as silanes. [5]

Silicones - Polymeric or oligomeric siloxanes, usually considered unbranched, of general formula $[-OSiR_2-]_n$ (R not equal to H). [5]

Siloxanes - Saturated silicon-oxygen hydrides with unbranched or branched chains of alternating silicon and oxygen atoms (each silicon atom is separated from its nearest silicon neighbors by single oxygen atoms). [5]

Skin effect - The concentration of high frequency alternating currents near the surface of a conductor.

Slater orbital - A particular mathematical expression for the radial part of the wave function of a single electron, which is used in quantum-mechanical calculations of the energy and other properties of atoms and molecules.

Small angle neutron scattering (SANS) - See Techniques for Materials Characterization, page 12-1.

Snell's law - The relation between the angle of incidence i and the angle

of refraction r of a light beam which passes from a medium of refractive index n_0 to a medium of index n_1 , viz., $\sin i/\sin r = n_1/n_0$.

Solar constant* - The mean radiant energy flux from the sun on a unit surface normal to the direction of the rays at the mean distance of the earth from the sun. The value is approximately 1373 W/m².

Solar wind - The stream of high velocity hydrogen and helium ions emitted by the sun which flows through the solar system and beyond.

Soliton - A spatially localized wave in a solid or liquid that can interact strongly with other solitons but will afterwards regain its original form.

Solubility* - A quantity expressing the maximum concentration of some material (the solute) that can exist in another liquid or solid material (the solvent) at thermodynamic equilibrium at specified temperature and pressure. Common measures of solubility include the mass of solute per unit mass of solution (mass fraction), mole fraction of solute, molality, molarity, and others.

Solubility product constant (K_{sp})* - The equilibrium constant for the dissolution of a sparsely soluble salt into its constituent ions.

Space group* - A group of symmetry operations (reflections, rotations, etc.) that leave a crystal invariant. A total of 230 space groups have been identified.

Spark source mass spectroscopy (SSMS) - See Techniques for Materials Characterization, page 12-1.

Specific gravity - Ratio of the mass density of a material to that of water. Since one must specify the temperature of both the sample and the water to have a precisely defined quantity, the use of this term is now discouraged.

Specific heat - Heat capacity divided by mass. See Heat capacity.

Specific quantity - It is often convenient to express an extensive quantity (e.g., volume, enthalpy, heat capacity, etc.) as the actual value divided by mass. The resulting quantity is called specific volume, specific enthalpy, etc.

Specific rotation $[\alpha]_D^t$ - For an optically active substance, defined by $[\alpha]_D^t = \alpha/\gamma l$, where α is the angle through which plane polarized light is rotated by a solution of mass concentration γ and path length l . Here θ is the Celsius temperature and λ the wavelength of the light at which the measurement is carried out. Also called specific optical rotatory power. [2]

Spin (s, I)* - A measure of the intrinsic angular momentum of a particle, which it possesses independent of its orbital motion. The symbol s is used for the spin quantum number of an electron, while I is generally used for nuclear spin.

Spiro compounds - Compounds having one atom (usually a quaternary carbon) as the only common member of two rings. [5]

Stacking fault - An error in the normal sequence of layer growth in a crystal.

Standard mean ocean water (SMOW) - A standard sample of pure water of accurately known isotopic composition which is maintained by the International Atomic Energy Agency. It is used for precise calibration of density and isotopic composition measurements.

Standard reduction potential (E°) - The zero-current potential of a cell in which the specified reduction reaction occurs at the right-hand electrode and the left-hand electrode is the standard hydrogen electrode. Also called Standard electrode potential.

Standard state - A defined state (specified temperature, pressure, concentration, etc.) for tabulating thermodynamic functions and carrying out thermodynamic calculations. The standard state pressure is usually taken as 100,000 Pa (1 bar), but various standard state temperatures are used. [2]

Stanton number (St) - A dimensionless quantity used in fluid mechanics, defined by $St = h/\rho v c_p$, where h is coefficient of heat transfer, ρ is

DEFINITIONS OF SCIENTIFIC TERMS (continued)

- density, v is velocity, and c_p is specific heat capacity at constant pressure. [2]
- Stark effect** - The splitting of an energy level of an atom or molecule, and hence a splitting of spectral lines arising from that level, as a result of the application of an external electric field.
- Statistical weight (g)** - The number of distinct states corresponding to the same energy level. Also called degeneracy.
- Stefan-Boltzmann constant (σ)*** - Constant in the equation for the radiant exitance M (radiant energy flux per unit area) from a black body at thermodynamic temperature T , viz. $M = \sigma T^4$. [1]
- Stibines** - SbH_3 and compounds derived from it by substituting one, two or three hydrogen atoms by hydrocarbyl groups: R_3Sb , RSbH_2 , R_2SbH , and R_3Sb (R not equal to H) are called primary, secondary and tertiary stibines, respectively. [5]
- Stochastic process** - A process which involves random variables and whose outcome can thus be described only in terms of probabilities.
- Stoichiometric number (ν)** - The number appearing before the symbol for each compound in the equation for a chemical reaction. By convention, it is negative for reactants and positive for products. [2]
- Stokes (St)** - A non-SI unit of kinematic viscosity, equal to $10^{-4} \text{ m}^2/\text{s}$.
- Stokes' law** - The statement, valid under certain conditions, that the viscous force F experienced by a sphere of radius a moving at velocity v in a medium of viscosity η is given by $F = -6\pi\eta av$.
- Strain** - The deformation of a body that results from an applied stress.
- Stratosphere** - The part of the earth's atmosphere extending from the top of the troposphere (typically 10 to 15 km above the surface) to about 50 km. It is characterized by an increase in temperature with increasing altitude.
- Stress** - Force per unit area (pressure) applied to a body. Tensile stress tends to stretch or compress the body in the direction of the applied force. Shear stress results from a tangential force which tends to twist the body.
- Strong interaction** - The short range (order of 1 fm) attractive forces between protons, neutrons, and other hadrons which are responsible for the stability of the nucleus.
- Strouhal number (Sr)** - A dimensionless quantity used in fluid mechanics, defined by $Sr = lf/v$, where l is length, f is frequency, and v is velocity. [2]
- Structure factor** - In x-ray crystallography, the sum of the scattering factors of all the atoms in a unit cell, weighted by an appropriate phase factor. The intensity of a given reflection is proportional to the square of the structure factor.
- Sublimation pressure** - The pressure of a gas in equilibrium with a solid at a specified temperature.
- Sulfides** - Compounds having the structure RSR (R not equal to H). Such compounds were once called thioethers. In an inorganic sense, salts or other derivatives of hydrogen sulfide. [5]
- Sulfones** - Compounds having the structure, $\text{RS(=O)}_2\text{R}$ (R not equal to H), e.g. $\text{C}_2\text{H}_5\text{S(=O)}_2\text{CH}_3$, ethyl methyl sulfone. [5]
- Sulfonic acids** - $\text{HS(=O)}_2\text{OH}$, sulfonic acid, and its S-hydrocarbyl derivatives. [5]
- Sulfoxides** - Compounds having the structure $\text{R}_2\text{S=O}$ (R not equal to H), e.g. $\text{Ph}_2\text{S=O}$, diphenyl sulfoxide. [5]
- Superconductor** - A material that experiences a nearly total loss of electrical resistivity below a critical temperature T_c . The effect can occur in pure metals, alloys, semiconductors, organic compounds, and certain inorganic solids.
- Superfluid** - A fluid with near-zero viscosity and extremely high thermal conductivity. Liquid helium exhibits these properties below 2.186 K (the λ point).
- Supernova** - A star in the process of exploding because of instabilities which follow the exhaustion of its nuclear fuel.
- Surface analysis by laser ionization (SALI)** - See Techniques for Materials Characterization, page 12-1.
- Surface tension (γ, σ)*** - The force per unit length in the plane of the interface between a liquid and a gas, which resists an increase in the area of that surface. It can also be equated to the surface Gibbs energy per unit area.
- Surfactant** - A substance which lowers the surface tension of the medium in which it is dissolved, and/or the interfacial tension with other phases, and accordingly is positively adsorbed at the liquid-vapor or other interfaces. [3]
- Susceptance (B)** - Imaginary part of admittance. [1]
- Svedberg** - A non-SI unit of time, used to express sedimentation coefficients, equal to 10^{-13} s .
- Syndiotactic macromolecule** - A tactic macromolecule, essentially comprising alternating enantiomeric configurational base units which have chiral or prochiral atoms in the main chain in a unique arrangement with respect to their adjacent constitutional units. In this case the repeating unit consists of two configurational base units that are enantiomeric. [8]
- Tacticity** - The orderliness of the succession of configurational repeating units of a macromolecule or oligomer molecule. In a tactic macromolecule essentially all the configurational repeating units are identical with respect to directional sense. See Configurational repeating unit, Isotactic, Syndiotactic. [8]
- Tautomerism** - Isomerism of the general form G-X-Y=Z 1 X=Y-Z-G , where the isomers (called tautomers) are readily interconvertible; the atoms connecting the groups X, Y, Z are typically any of C, H, O, or S, and G is a group which becomes an electrofuge (i.e., a group that does not carry away the bonding electron pair when it leaves its position in the molecule) or nucleofuge (a group that does carry away the bonding electrons when leaving) during isomerization. The commonest case, when the electrofuge is H^+ , is also known as prototropy. A common example, written so as to illustrate the general pattern given above, is keto-enol tautomerism, such as
- $\text{H-O-C(CH}_3\text{)=CH-CO}_2\text{Et}$ (enol) 1 $(\text{CH}_3\text{)C(=O)-CH}_2\text{-CO}_2\text{Et}$ (keto)
- In some cases the interconversion rate between tautomers is slow enough to permit isolation of the separate keto and enol forms. [5]
- Tensile strength*** - In tensile testing, the ratio of maximum load a body can bear before breaking to original cross-sectional area. Also called ultimate strength. [11]
- Terpenes** - Hydrocarbons of biological origin having carbon skeletons formally derived from isoprene [$\text{CH}_2=\text{C}(\text{CH}_3)\text{CH}=\text{CH}_2$]. [5]
- Terpenoids** - Natural products and related compounds formally derived from isoprene units. They contain oxygen in various functional groups. The skeleton of terpenoids may differ from strict additivity of isoprene units by the loss or shift of a methyl (or other) group. [5]
- Tesla (T)*** - The SI unit of magnetic flux density (B), equal to V s/m^2 . [1]
- Thermal conductivity*** - Rate of heat flow divided by area and by temperature gradient. [1]
- Thermal diffusivity** - Thermal conductivity divided by density and by specific heat capacity at constant pressure. [1]
- Thermal expansion coefficient (α)*** - The linear expansion coefficient is defined by $\alpha_l = (1/l)(dl/dT)$; the volume expansion coefficient by $\alpha_v = (1/V)(dV/dT)$. [1]
- Thermionic emission** - The emission of electrons from a solid as a result of heat. The effect requires a high enough temperature to impart sufficient kinetic energy to the electrons to exceed the work function of the solid.
- Thermodynamic laws** - The foundation of the science of thermodynamics:

DEFINITIONS OF SCIENTIFIC TERMS (continued)

- First law:** The internal energy of an isolated system is constant; if energy is supplied to the system in the form of heat dq and work dw , then the change in energy $dU = dq + dw$.
- Second law:** No process is possible in which the only result is the transfer of heat from a reservoir and its complete conversion to work.
- Third law:** The entropy of a perfect crystal approaches zero as the thermodynamic temperature approaches zero.
- Thermoelectric power** - For a bar of a pure material whose ends are at different temperatures, the potential difference divided by the difference in temperature of the ends. See also Seebeck effect.
- Thermogravimetric analysis (TGA)** - See Techniques for Materials Characterization, page 12-1.
- Thermosphere** - The layer of the earth's atmosphere extending from the top of the mesosphere (typically 80-90 km above the surface) to about 500 km. It is characterized by a rapid increase in temperature with increasing altitude up to about 200 km, followed by a leveling off in the 300-500 km region.
- Thiols** - Compounds having the structure RSH (R not equal to H). Also known by the term mercaptans (abandoned by IUPAC); e.g. $\text{CH}_3\text{CH}_2\text{SH}$, ethanethiol. [5]
- Thomson coefficient** (μ , τ) - The heat power developed in the Thomson effect (whereby heat is evolved in a conductor when a current is flowing in the presence of a temperature gradient), divided by the current and the temperature difference. [1]
- Tonne (t)** - An alternative name for megagram (1000 kg). [1]
- Torque (T)** - For a force F that produces a torsional motion, $T = r \times F$, where r is a vector from some reference point to the point of application of the force.
- Torr** - A non-SI unit of pressure, equal to 133.322 Pa. The name is generally considered interchangeable with millimeter of mercury.
- Townsend coefficient** - In a radiation counter, the number of ionizing collisions by an electron per unit path length in the direction of an applied electric field.
- Transducer** - Any device that converts a signal from acoustical, optical, or some other form of energy into an electrical signal (or vice versa) while preserving the information content of the original signal.
- Transistor** - A voltage amplifier using controlled electron currents inside a semiconductor.
- Transition metals** - Elements characterized by a partially filled d subshell. The First Transition Series comprises Sc, Ti, V, Cr, Mn, Fe, Co, Ni, Cu. The Second and Third Transition Series include the lanthanides and actinides, respectively. [7]
- Transition probability*** - See Einstein transition probability.
- Transmittance** (τ) - Ratio of the radiant or luminous flux at a given wavelength that is transmitted to that of the incident radiation. Also called transmission factor. [1]
- Tribology** - The study of frictional forces between solid surfaces.
- Triple point*** - The point in p, T space where the solid, liquid, and gas phases of a substance are in thermodynamic equilibrium. The corresponding temperature and pressure are called the triple point temperature and triple point pressure.
- Troposphere** - The lowest part of the earth's atmosphere, extending to 10-15 km above the surface. It is characterized by a decrease in temperature with increasing altitude. The exact height varies with latitude and season.
- Tunnel diode** - A device involving a p-n junction in which both sides are so heavily doped that the Fermi level on the p-side lies in the valence band and on the n-side in the conduction band. This leads to a current-voltage curve with a maximum, so that the device exhibits a negative resistance in some regions.
- Ultraviolet photoelectron spectroscopy (UPS)** - See Techniques for Materials Characterization, page 12-1.
- Umklapp process** - A process involving the interaction of three or more waves (lattice or electron) in a solid in which the sum of the wave vectors does not equal zero.
- Unified atomic mass unit (u)*** - A unit of mass used in atomic, molecular, and nuclear science, defined as the mass of one atom of ^{12}C divided by 12. Its approximate value is 1.66054×10^{-27} kg. [1]
- Universal time (t_U , UT)** - Mean solar time counted from midnight at the Greenwich meridian. Also called Greenwich mean time (GMT). The interval of mean solar time is based on the average, over one year, of the time between successive transits of the sun across the observer's meridian.
- Vacancy** - A missing atom or ion in a crystal lattice.
- Van Allen belts** - Two toroidal regions above the earth's atmosphere containing protons and electrons. The outer belt at about 25,000 km above the surface is probably of solar origin. The inner belt at about 3000 km contains more energetic particles from outside the solar system.
- Van der Waals' equation*** - An equation of state for fluids which takes the form:
- $$pV_m = RT \left(\frac{1}{V_m - b} - \frac{a}{V_m^2} \right)$$
- where p is pressure, V_m is molar volume, T is temperature, R is the molar gas constant, and a and b are characteristic parameters of the substance which describe the effect of attractive and repulsive intermolecular forces, respectively.
- Van der Waals' force** - The weak attractive force between two molecules which arises from electric dipole interactions. It can lead to the formation of stable but weakly bound dimer molecules or clusters.
- Van't Hoff equation** - The equation expressing the temperature dependence of the equilibrium constant K of a chemical reaction:
- $$\frac{d \ln k}{dT} = \frac{\Delta_r H^\circ}{RT^2}$$
- where $\Delta_r H^\circ$ is the standard enthalpy of reaction, R the molar gas constant, and T the temperature. Also called van't Hoff isochore.
- Vapor pressure*** - The pressure of a gas in equilibrium with a liquid (or, in some usage, a solid) at a specified temperature.
- Varistor** - A device that utilizes the properties of certain metal oxides with small amounts of impurities, which show abrupt nonlinearities at specific voltages where the material changes from a semiconductor to an insulator.
- Velocity (v)** - Rate of change of distance with time.
- Verdet constants (V)*** - Angle of rotation of a plane polarized light beam passing through a medium in a magnetic field, divided by the field strength and by the path length.
- Virial equation of state*** - An equation relating the pressure p , molar volume V_m , and temperature T of a real gas in the form of an expansion in powers of the molar volume, viz., $pV_m = RT(1 + BV_m^{-1} + CV_m^{-2} + \dots)$, where R is the molar gas constant. B is called the second virial coefficient, C the third virial coefficient, etc. The virial coefficients are functions of temperature.
- Viscosity (η)*** - The proportionality factor between shear rate and shear stress, defined through the equation $F = \eta A(dv/dx)$, where F is the tangential force required to move a planar surface of area A at velocity v relative to a parallel surface separated from the first by a distance x . Sometimes called dynamic or absolute viscosity. The term kinematic viscosity (symbol ν) is defined as η divided by the mass density.
- Volt (V)*** - The SI unit of electric potential, equal to W/A. [1]
- Volume fraction (ϕ_j)** - Defined as $V_j/\Sigma_i V_i$, where V_j is the volume of the specified component and the V_i are the volumes of all the components of a mixture prior to mixing. [2]

DEFINITIONS OF SCIENTIFIC TERMS (continued)

- Watt (W)*** - The SI unit of power, equal to J/s. [1]
- Wave function** - A function of the coordinates of all the particles in a quantum mechanical system (and, in general, of time) which fully describes the state of the system. The product of the wave function and its complex conjugate is proportional to the probability of finding a particle at a particular point in space.
- Weak interaction** - The weak forces (order of 10^{-12} of the strong interaction) between elementary particles which are responsible for beta decay and other nuclear effects.
- Weber (Wb)*** - The SI unit of magnetic flux, equal to V s. [1]
- Weber number (We)** - A dimensionless quantity used in fluid mechanics, defined by $We = \rho v^2 l / \gamma$, where ρ is density, v is velocity, l is length, and γ is surface tension. [2]
- Weight** - That force which, when applied to a body, would give it an acceleration equal to the local acceleration of gravity. [1]
- Wiedeman-Franz law** - The law stating that the thermal conductivity k and electrical conductivity σ of a pure metal are related by $k = L\sigma T$, where T is the temperature and L (called the Lorenz ratio) has the approximate value $2.45 \times 10^{-8} \text{ V}^2/\text{K}^2$.
- Wien displacement law** - The relation, which can be derived from the Planck formula for black body radiation, that $\lambda_{\text{max}} T = 0.0028978 \text{ m K}$, where λ_{max} is the wavelength of maximum radiance at temperature T .
- Wigner-Seitz method** - A method of calculating electron energy levels in a solid using a model in which each electron is subject to a spherically symmetric potential.
- Wittig reagents** - See phosphonium ylides.
- Work (W)** - Force multiplied by the displacement in the direction of the force. [1]
- Work function (Φ)*** - The energy difference between an electron at rest at infinity and an electron at the Fermi level in the interior of a substance. It is thus the minimum energy required to remove an electron from the interior of a solid to a point just outside the surface. [1]
- X unit (X)** - A unit of length used in x-ray crystallography, equal to approximately $1.002 \times 10^{-13} \text{ m}$.
- X-ray photoelectron spectroscopy (XPS)** - See Techniques for Materials Characterization, page 12-1.
- Yield strength** - The stress at which a material exhibits a specified deviation (often chosen as 0.2% for metals) from proportionality of stress and strain. [11]
- Young's modulus (E)** - In tension or compression of a body below its elastic limit, the ratio of stress to corresponding strain. Since strain is normally expressed on a fractional basis, Young's modulus has dimensions of pressure. Also called elastic modulus. [11]
- Zeeman effect** - The splitting of an energy level of an atom or molecule, and hence a splitting of spectral lines arising from that level, as a result of the application of an external magnetic field.
- Zener diode** - A control device utilizing a p-n junction with a well defined reverse-bias avalanche breakdown voltage.
- Zeotrope** - A liquid mixture that shows no maximum or minimum when vapor pressure is plotted against composition at constant temperature. See Azeotrope.
- Zero-point energy** - The energy possessed by a quantum mechanical system as a result of the uncertainty principle even when it is in its lowest energy state; e.g., the difference between the lowest energy level of a harmonic oscillator and the minimum in the potential well.
- Zeta potential (ζ)** - The electric potential at the surface of a colloidal particle relative to the potential in the bulk medium at a long distance. Also called electrokinetic potential.
- Zwitterions** - Neutral compounds having formal unit electrical charges of opposite sign. Some chemists restrict the term to compounds with the charges on non-adjacent atoms. Sometimes referred to as inner salts, dipolar ions (a misnomer). [5]

THERMODYNAMIC FUNCTIONS AND RELATIONS

p = pressure V = volume T = temperature
 n_i = amount of substance i
 $x_i = n_i/\Sigma_j n_j$ = mole fraction of substance i

Energy	U
Entropy	S
Enthalpy	$H = U + pV$
Helmholtz energy	$A = U - TS$
Gibbs energy	$G = U + pV - TS$
Isobaric heat capacity	$C_p = (\partial H/\partial T)_p$
Isochoric heat capacity	$C_V = (\partial U/\partial T)_V$
Isobaric expansivity	$\alpha = V^{-1}(\partial V/\partial T)_p$
Isothermal compressibility	$\kappa_T = -V^{-1}(\partial V/\partial p)_T$
Isentropic compressibility	$\kappa_S = -V^{-1}(\partial V/\partial p)_S$
	$\kappa_T - \kappa_S = T\alpha^2 V/C_p$
	$C_p - C_V = T\alpha^2 V/\kappa_T$
Gibbs-Helmholtz equation	$H = G - T(\partial G/\partial T)_p$
Maxwell relations	$(\partial S/\partial p)_T = -(\partial V/\partial T)_p$
	$(\partial S/\partial V)_T = -(\partial p/\partial T)_V$
Joule-Thomson expansion	$\mu_{JT} = (\partial T/\partial p)_H = -\{V - T(\partial V/\partial T)_p\}/C_p$
	$\phi_{JT} = (\partial H/\partial p)_T = V - T(\partial V/\partial T)_p$
Partial molar quantity	$X_i = (\partial X/\partial n_i)_{T,p,n_{j\neq i}}$
Chemical potential	$\mu_i = (\partial G/\partial n_i)_{T,p,n_{j\neq i}}$
Perfect gas [symbol ^{pg}]	$pV = (\Sigma_i n_i)RT$
	$\mu_i^{pg} = \mu_i^\theta + RT \ln(x_i p/p^\theta)$
Fugacity	$f_i = (x_i p) \exp\{(\mu_i - \mu_i^{pg})/RT\}$
Activity coefficient	$\gamma_i = f_i/(x_i f_i^\theta)$
Gibbs-Duhem relation	$0 = SdT - Vdp + \Sigma_i n_i d\mu_i$

[Superscript θ in above equations indicates standard state]

Notation for chemical and physical changes ($X = H, S, G$, etc.):

Chemical reaction	$\Delta_r X$
Formation from elements	$\Delta_f X$
Combustion	$\Delta_c X$
Fusion (cry→liq)	$\Delta_{fus} X$
Vaporization (liq→gas)	$\Delta_{vap} X$
Sublimation (cry→gas)	$\Delta_{sub} X$
Phase transition	$\Delta_{trs} X$
Solution	$\Delta_{sol} X$
Mixing	$\Delta_{mix} X$
Dilution	$\Delta_{dil} X$

PHYSICAL CONSTANTS OF ORGANIC COMPOUNDS

The basic physical constants and structure diagrams for about 10,900 organic compounds are presented in this table. An effort has been made to include the compounds most frequently encountered in the laboratory, the workplace, and the environment. Particular emphasis has been given to substances that are considered environmental or human health hazards. In making the selection of compounds for the table, added weight was assigned to the appearance of a compound in various lists or reference sources such as:

- Laboratory reagent lists, e.g., the *ACS Reagent Chemicals* volume (Ref. 1)
- The DIPPR list of industrially important compounds (Ref. 2) and the (much larger) TSCA Inventory of chemicals used in commerce
- The Hazardous Substance Data Bank (Ref. 3)
- The UNEP list of Persistent Organic Pollutants (Ref. 4)
- Chemicals on Reporting Rules (CORR), a database of about 7500 regulated compounds prepared by the Environmental Protection Agency (Ref. 5)
- The EPA Integrated Risk Information System (IRIS), a database of human health effects of exposure to chemicals in the environment (Ref. 6)
- Compendia of chemicals of biochemical or medical importance, such as *The Merck Index* (Ref. 10)
- Specialized tables in this *Handbook*

It should be noted that the above lists vary widely in their choice of chemical names, and even in the use of Chemical Abstracts Registry Numbers. To the extent possible, we have attempted to systematize the names and registry numbers for this table.

Clearly, criteria of this type are somewhat subjective, and compounds considered important by some users have undoubtedly been omitted. Suggestions for additional compounds or other improvements are welcomed.

The data in the table have been derived from many sources, including both the primary literature and evaluated compilations. The *Handbook of Data on Organic Compounds, Third Edition* (Reference 7) and the *Chapman & Hall/CRC Combined Chemical Dictionary* (Reference 8) were important sources. Other useful compilations of physical property data for organic compounds are listed in References 9-19. Many boiling point values (and some melting point and density values) were taken from recent physical chemistry literature dealing with fluid properties. Where conflicts were found, the value deemed most reliable was chosen.

The table is arranged alphabetically by substance name, which generally is either an IUPAC systematic name or, in the case of pesticides, pharmaceuticals, and other complex compounds, a simple trivial name. Names in ubiquitous use, such as acetic acid and formaldehyde, are adopted rather than their systematic equivalents. Synonyms are given in the column following the primary name, and structure diagrams are given below the data listing. The explanation of the data columns follows:

- **No.:** An identification number used in the indexes.
- **Name:** Primary name of the substance
- **Synonym:** A synonym in common use. When the primary name is non-systematic, a systematic name may appear here.
- **Mol. Form.:** The molecular formula written in the Hill convention.
- **CAS RN.:** The Chemical Abstracts Service Registry Number for the compound.
- **Mol. Wt.:** Molecular weight (relative molar mass) as calculated with the 2001 IUPAC Standard Atomic Weights.
- **Physical Form:** A notation of the physical phase, color, crystal type, or other features of the compound at ambient temperature. Abbreviations are given below.
- **mp:** Normal melting point in °C. A value is sometimes followed by “dec”, indicating decomposition is observed at the stated temperature (so that it is probably not a true melting point). The notation “tp” indicates a triple point, where solid, liquid, and gas are in equilibrium.
- **bp:** Normal boiling point in °C, if it is available. This is the temperature at which the liquid phase is in equilibrium with the vapor at a pressure of 760 mmHg (101.325 kPa). A notation “sp” following the value indicates a sublimation point, where the vapor pressure of the solid phase reaches 760 mmHg. When a notation such as “dec” or “exp” (explodes) follows the value, the temperature may not be a true boiling point. A simply entry “sub” indicates the solid has a significant sublimation pressure at ambient temperatures. The boiling point at reduced pressure is listed in some cases, with or without the normal boiling point. Here the superscript indicates the pressure in mmHg.
- **den:** Density (mass per unit volume) in g/cm³. The temperature in °C is indicated by a superscript. Values refer to the liquid or solid phase, and all values are true densities, not specific gravities. The number of decimal places gives a rough estimate of the accuracy of the value.
- **n_D:** Refractive index, at the temperature in °C indicated by the superscript. Unless otherwise indicated, all values refer to a wavelength of 589 nm (sodium D line). Values are given only for liquids and solids.
- **Solubility:** Qualitative indication of solubility in common solvents. Abbreviations are:
 - i insoluble
 - sl slightly soluble
 - s soluble
 - vs very soluble
 - misc miscible
 - dec decomposes

Abbreviations for solvents are given below.

PHYSICAL CONSTANTS OF ORGANIC COMPOUNDS (continued)

In order to facilitate the location of compounds in the table, three indexes are provided:

- **Synonym Index:** Includes common synonyms, but not the primary name by which the table is arranged.
- **Molecular Formula Index:** Lists compounds by molecular formula in the Hill Order (see Introduction to this *Handbook*).
- **CAS Registry Number Index:** Lists compounds by Chemical Abstracts Service Registry Number. Note there is some redundancy in this index, because many compounds have several Registry Numbers associated with them. Thus the CAS RN in a table entry may differ from the CAS RN which points to it in the index. For example, CAS RN 1319-77-3 in the index points to all three cresol isomers, each of which has its own specific CAS RN.

The assistance of Fiona Macdonald in checking names and formulas is gratefully acknowledged, as well as the efforts of Janice Shackleton, Trupti Desai, Nazila Kamaly, Matt Griffiths, and Lawrence Braschi in preparing the structure diagrams.
